PREFACE

This chapter of Volume I presents detailed data on the characteristics of housing units for the United States, regions, and divisions, with separate statistics for units inside and outside standard metropolitan statistical areas. This chapter also summarizes statistics published in the individual State chapters for States and the District of Columbia, and for standard metropolitan statistical areas and places of 100,000 inhabitants or more. Volume I presents basic statistics on all subjects for which information was collected in the Census of Housing taken as of April 1, 1960.

The chapters of Volume I were published first as a series of reports, Series HC(1). A separate report was published for the United States and for each of the 50 States and the District of Columbia, Puerto Rico, Guam, and the Virgin Islands of the United States. Part 1 of the volume consists of the United States Summary chapter; Parts 2 to 8 contain the chapters for the States and the District of Columbia; and Part 9 contains the chapters for Puerto Rico, Guam, and the Virgin Islands of the United States. The State chapters provide data for the State, for each standard metropolitan statistical area, urbanized area, place of 1,000 inhabitants or more, and county, and for the rural-farm and rural-nonfarm units in each county.

Authorization for the 1960 Census of Housing was provided in the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13, United States Code. The law provides for a decennial census of housing, including utilities and equipment, to be taken in each of the 50 States, the District of Columbia, the Virgin Islands, Guam, and the Commonwealth of Puerto Rico.

The census program was designed in consultation with advisory committees and individuals to achieve a census having optimum value to users of housing statistics. The Housing Advisory Committee was organized by the Director of the Bureau of the Census and was made up of persons in private industry, universities, and local governments. It advised on various aspects of the housing census programs except the technical phases of the Residential Finance program for which the Technical Advisory Committee on Residential Finance was organized. A Federal Agency Population and Housing Census Council, organized by the Bureau of the Budget and made up of persons in Federal agencies, also advised on the basic programs. A joint staff committee, set up by the Administrator of the Housing and Home Finance Agency and the Director of the Bureau of the Census, concentrated on aspects of particular interest to the housing agencies. In addition to the committees, working groups of specialists in housing subjects assisted the Census Bureau staff in the evaluation and improvement of housing concepts. A number of other committees, groups, and individuals also made contributions to the planning of the housing census.

August 1963.

ACKNOWLEDGMENTS

A number of persons both within and outside the Bureau of the Census participated in the various activities of the 1960 Census of Housing. Specific responsibilities were exercised by members of the Housing, Demographic Operations, Field, Geography, and Statistical Methods Divisions of the Census Bureau. Volume I was planned under the direction of Wayne F. Daugherty, then Chief, Housing Division, who was succeeded by Daniel B. Rathbun; the publication was completed under the general supervision of Arthur F. Young, Acting Chief. The statistical presentation of the detailed tables was developed by Nathan Krevor, Chief, Coordination and Research Branch, assisted by William E. Grubbs, Charles J. Hedetniemi, Jr., Matthew J. Rose, and Leonard J. Norry. The text materials, including the analytical findings in the United States Summary, were prepared by Beulah Washabaugh, Special Assistant, assisted by Aneda E. France, Elmo E. Beach, Mildred Lam, Hazel H. Moore, and Mary E. Barstow. Frank S. Kristof, then Assistant Chief, Housing Division, and Naomi D. Rothwell were in charge of the housing subjects in the training program for the collection of data. Others who were responsible for a specific phase of the program include J. Hugh Rose, Chief, Structural Statistics Branch, assisted by Meyer Zitter and Arthur G. Dukakis; Herbert Shapiro, Chief, Financial Statistics Branch; Alexander C. Findlay, Chief, Facilities and Equipment Branch; and Milton D. Lieberman, then Chief, Coordination and Research Branch.

Important contributions were made by Glen S. Taylor, then Chief, Richard A. Hornseth, Denver K. Ingram, Patience Lauriat, Richard J. Rice, Betty Mitchell, and Bernadette H. Marlow of the Demographic Operations Division in the processing of the data; Robert B. Voight, then Chief, Jefferson D. McPike, Ivan G. Munro, and George K. Klink of the Field Division in the collection of the information, and Genevieve D. Welsh in the coordination of enumerator instructions; William T. Fay, Robert C. Klove, and Robert L. Hagan of the Geography Division in the delineation of special types of urban territory and other geographic work, and George W. Morris in the preparation of maps and charts; Joseph Steinberg, Robert H. Hanson, Herman Fasteau, George Minton, Warren J. Mitofsky, Barbara A. Boyes, Kathern Clay, and Anthony Turner of the Statistical Methods Division in planning the sampling, estimation, and quality control procedures. William N. Hurwitz, Chief, Statistical Research Division, assisted by Harold Nisselson, Jack Silver, Leon Gilford, and William H. Cook were instrumental in the formulation of field plans. Sheldon M. Klein and Ingrid L. Millison of the Statistical Reports Division reviewed text material and table format. The technical editorial work was under the supervision of Mildred M. Russell of the Population Division, assisted by Louise L. Douglas. Robert H. Brooks of the Administrative Service Division was responsible for the printing arrangements.

Important contributions were also made by the staffs of the Administrative Service Division, Everett H. Burke, Chief; Budget and Management Division, Charles H. Alexander, Chief; Census Operations Office, Robert D. Krook, Executive Officer; Data Processing Systems Division, Robert F. Drury, Chief; Personnel Division, James P. Taff, Chief; and Statistical Reports Division, Edwin D. Goldfield, Chief.

The regional directors who were responsible for the conduct of the census in the field were: Meredith A. Bass, Edgar L. Bryan, John G. Gibson, Leonard C. Isley, Guy A. Lutz, Thomas W. McWhirter, Percy R. Millard, Joseph R. Norwood, Theodore F. Olson, Guy E. Rainboth, James W. Stroud, John E. Tharaldson, Jack W. Traverse, Jr., James W. Turbitt, Francis H. Wilmer, Hobert A. Yerkey, and Arthur F. Young.

The Housing Advisory Committee aided the Bureau in the selection of subjects, concepts, and definitions used. The Bureau staff called upon members of the committee for advice in planning the census, and their counsel and guidance were invaluable in developing the program. Members of the committee were: Miles L. Colean, Chairman, Glenn H. Beyer, L. Durward Badgley, Charles Blessing, Edward E. Edwards, Ernest M. Fisher, Arthur S. Goldman, Catherine Martini, Martin Meyerson, Davis McEntire, Hugh Miels, Jr., Anthony J. Nesti, Daniel Parson, Nathaniel H. Rogg, Bert Seidman, William H. Shaw, William J. Shickler, William Slayton, James F. Steiner, and Robert C. Weaver. Two working groups under the leadership of J. Hugh Rose developed the unit of enumeration and a revised measure of condition of housing; their work led to the adoption of the "housing unit" and to the use of three categories for condition. Those who served were: E. Everett Ashley, III, Lawrence N. Bloomberg, Glenn H. Beyer, Carl A. S. Coan, Miles L. Colean, Mason Doan, Paul C. Glick, Morton Hoffman, the late John Innes, Benjamin Lipstein, Orville O. McCracken, Ivan G. Munro, Catherine Martini, Chester Rapkin, and Bert Seidman.

PUBLICATION PROGRAM OF THE 1960 CENSUS OF HOUSING

Results of the 1960 Census of Housing are published in seven housing volumes as described below. A separate series containing the census tract reports is a joint publication with data from both the 1960 Census of Housing and the 1960 Census of Population. A series of special reports for local housing authorities constitutes the remainder of the final reports. The source of the data is the April 1960 enumeration, except for Volumes IV and V which are based largely on the enumeration of units in a sample of land area segments, started in late 1959 and completed in 1960. Prior to the final reports, several series of preliminary and advance reports were issued. Some unpublished statistics can be obtained for the cost of preparing a copy and certain special tabulations can be prepared, on a reimbursable basis, on request to the Chief, Housing Division, Bureau of the Census, Washington 25, D.C.

Volume I (Series HC(1) reports). States and Small Areas. Information about all subjects covered in the April 1960 enumeration, with a separate report for the United States by regions and geographic divisions, each of the 50 States, the District of Columbia, Puerto Rico, Guam, and the Virgin Islands of the United States. In the State reports, information is shown for the State; each standard metropolitan statistical area and its constituent parts; each urbanized area, place of 1,000 inhabitants or more, and county; and the rural-farm and rural-nonfarm parts of each county. The volume covers occupancy characteristics, structural characteristics, condition and plumbing facilities, equipment and fuels, and financial characteristics. The subjects are: Color, persons, persons per room, tenure, year moved into unit, vacancy status, and duration of vacancy; basement, bedrooms, elevator in structure, rooms, units in structure, and year structure built; bathing facilities, bathrooms, condition, sewage disposal, source of water, toilet facilities, and water supply; air conditioning, automobiles available, clothes dryer, clothes washing machine, cooking fuel, heating equipment, heating fuel, home food freezer, radio sets, telephone available, television sets, and water heating fuel; contract rent, gross rent, and value.

Volume II (Series HC(2) reports). Metropolitan Housing. Cross-tabulations of housing and household characteristics, with a separate report for the United States by geographic divisions, and for each of the 192 standard metropolitan statistical areas of 100,000 inhabitants or more in the United States and Puerto Rico. Separate statistics for each of the 134 places of 100,000 inhabitants or more are included in the metropolitan area reports.

Volume III (Series HC(3) reports). City Blocks. Separate reports for cities and other urban places having 50,000 inhabitants or more prior to and at the time of the 1960 Census, and for a number of smaller localities which arranged for block statistics. Data for a limited number of characteristics are presented by blocks. Statistics for 466 cities and localities in the United States and Puerto Rico are published in 420 separate reports.

Volume IV (Series HC(4) reports). Components of Inventory Change. Information on the source of the 1959 inventory and the disposition of the 1950 and 1956 inventories. Data are provided for components of change such as new construction, conversion, merger, demolition, and other additions and losses. Part 1 of the volume contains the 1950 to 1959 comparison, with a separate report for the United States by regions, and each of 17 selected metropolitan areas (15 standard metropolitan statistical areas, defined as of June 8, 1959, and 2 standard consolidated areas). Part 1 is published in two sets of reports for each area. Part 1A presents basic 1950 and 1959 data, with emphasis on the counts and characteristics of the components of change; Part 1B presents additional information on characteristics of the inventory, including characteristics of the present and previous residences of recent movers. Part 2 contains the 1957 to 1959 comparison, with a separate report for conterminous United States by regions, and separate reports for 9 of the selected areas (standard metropolitan areas defined for the 1956 inventory).

Volume V. Residential Finance. Information on financing of residential property, including characteristics of mortgages, properties, and homeowners. Part 1 of the volume is a report on homeowner properties for the United States by regions, and each of 17 selected metropolitan areas (15 standard metropolitan statistical areas, defined as of June 8, 1959, and 2 standard consolidated areas). Part 2 is a report on rental and vacant properties for the United States.

Volume VI. Rural Housing. Cross-tabulations of housing and household characteristics of rural-farm and rural-nonfarm housing units for the United States and each of the 121 economic subregions.

Volume VII. Housing of Senior Citizens. Cross-tabulations of housing and household characteristics of units occupied by persons 60 years old and over, for the United States, each of the 50 States and the District of Columbia, and selected standard metropolitan statistical areas.

Series PHC(1) reports. Census Tracts. Separate reports for 180 tracted areas in the United States and Puerto Rico. The reports contain information, by census tracts, on both housing and population subjects. (This series is the same as the tract reports included in the publication program for the 1960 Census of Population.)

Series HC(S1) reports. Special Reports for Local Housing Authorities. Separate reports for 139 localities in the United States. The program was requested by, and planned in cooperation with, the Public Housing Administration. The reports contain data on both owner- and renter-occupied housing units defined as substandard by Public Housing Administration criteria, with emphasis on gross rent, size of family, and income of renter families.

VOLUME I

This volume comprises nine parts, with the States arranged alphabetically and followed by Puerto Rico, Guam, and the Virgin Islands of the United States. Data for the United States, each State and the District of Columbia, and each of the outlying areas are presented as separate chapters. The areas included in each part are listed below by chapter number:

Part 1

1. United States Summary

Part 2

2. Alabama
3. Alaska
4. Arizona
5. Arkansas
6. California
7. Colorado
8. Connecticut

Part 3

9. Delaware
10. District of Columbia
11. Florida
12. Georgia
13. Hawaii
14. Idaho
15. Illinois
16. Indiana

Part 4

17. Iowa
18. Kansas

Part 4—Continued

19. Kentucky
20. Louisiana
21. Maine
22. Maryland
23. Massachusetts

Part 5

24. Michigan
25. Minnesota
26. Mississippi
27. Missouri
28. Montana
29. Nebraska
30. Nevada
31. New Hampshire

Part 6

32. New Jersey
33. New Mexico
34. New York
35. North Carolina
36. North Dakota
37. Ohio

Part 7

38. Oklahoma
39. Oregon
40. Pennsylvania
41. Rhode Island
42. South Carolina
43. South Dakota
44. Tennessee

Part 8

45. Texas
46. Utah
47. Vermont
48. Virginia
49. Washington
50. West Virginia
51. Wisconsin
52. Wyoming

Part 9¹

53. Puerto Rico
54. Guam
55. Virgin Islands of the United States

¹ Chapters for outlying areas differ in detail from those for the States; statistics for outlying areas not included in the totals in Part 1.

¹ 1960 data for rural-nonfarm units not shown in table W; 1950 data shown for rural units in tables C and W but not for rural-nonfarm and rural-farm units.

² Data on financial characteristics exclude farm units and certain other units; see definition. All vacant units in rural territory included in rural-nonfarm inventory.

³ Table X provides characteristics of units with nonwhite household heads for the United States, inside SMSA's (separately by "in central cities" and "not in central cities") and outside SMSA's. For tables F, G, H, and W and figures 8 and 17, entries in this column are duplicated in preceding columns; for areas covered, refer to entries for stub items "by color."

⁴ In table B, figures are shown for inside SMSA's (separately by "in central cities" and "not in central cities") and outside SMSA's. In table C, 1960 figures are shown for urban units and rural units (separately by "nonfarm" and "farm"); 1950 figures are shown for urban units and rural units.

⁵ Data for cities of 250,000 inhabitants or more are provided in table D; data for SMSA's of 1,000,000 inhabitants or more and their central cities are provided in figure 12.

⁶ Data for "not in central cities" not shown in table L.

⁷ Restricted to conterminous United States.

United States Summary

SUMMARY OF FINDINGS

The 1960 Census of Housing marks the third decennial census of housing in the United States. Although the first census of housing was not taken until 1940, information on a few housing items is available for earlier years from the decennial censuses of population and agriculture. In recent years, particularly after the considerable housing activity in the 1920's, the depression of the early 1930's, and the housing shortages during and immediately after World War II, there has been increasing need for information not only on the growth of the inventory but also on the utilization and characteristics of the housing supply.

The high rate of residential construction activity shortly after World War II continued almost unabated to the time of the 1960 Census. By 1960, the housing inventory included approximately 16.0 million units which had been built during the 1950's. Demolitions and other losses also occurred, although in smaller volume. On balance, the housing inventory increased by more than 12 million units since the 1950 Census. The addition of a large number of units through new construction and the removal of a sizeable number of units through demolition and other means contributed to modernization of the housing stock.

Homeownership gained impressively. The proportion of homeowners in 1960 was larger than at any other census date for which information on tenure was collected. Quality of housing improved during the decade, as evidenced by the substantial decrease in the

number of units which were in dilapidated condition or lacked plumbing facilities. Furthermore, housing units were less crowded than in 1950. While the average (median) number of persons per household decreased slightly between 1950 and 1960, the average (median) number of rooms per unit increased. More persons were living alone and there was a sharp decline in the number of married couples who were sharing the living quarters of others. Household equipment and facilities such as television sets, radios, clothes washing machines, telephones, and automobiles were found to be fairly widespread in contrast to air conditioning, clothes dryers, and home food freezers.

Vacancy rates for 1960 indicate a lessening of the severe post-war housing shortage evident at the time of the 1950 Census. The supply of available vacant units more than doubled since 1950. In 1960, about 1 in every 30 housing units was vacant and available for sale or for rent.

The mobility of the American public was indicated by the fairly short duration of occupancy reported for homeowners as well as for renters. Over one-fifth of the households moved at least once between January 1959 and the time of the census in April 1960. Migration from farms to metropolitan centers during the decade was accompanied by a large movement which took place from cities to suburbs. The concentration of new construction outside the central cities in metropolitan areas is an indication of this movement.

Table A.—HOUSING UNITS BY REGIONS AND DIVISIONS: 1940 TO 1960

[Occupied and vacant units. Figures for 1960 based partly on sample and essentially in agreement with complete count; figures for 1950 and 1940 based on complete count. "Housing unit" used in 1960, "dwelling unit" in 1950 and 1940]

¹ Figures include 120,606 total units for Hawaii and 33,072 total units for Alaska.

² Figures include 90,830 total units for Hawaii and 22,414 occupied units for Alaska (vacant units not having been enumerated).

Both the median value of owner-occupied units and the median gross rent of renter-occupied units increased substantially during the 1950's. Relatively, the increase in median gross rent was somewhat larger than the increase in median value.

Overall, results of the 1960 Census of Housing indicate that people were better housed than they were 10 years earlier. Nevertheless, there were a number of families whose living accommodations may be considered inadequate for their well-being.

In the discussion which follows, the term "United States" is used without qualification and refers to the 50 States and the District of Columbia. In a few instances, however, statistics are restricted to conterminous United States (that is, United States exclusive of Alaska and Hawaii). Statistics for conterminous United States are identified in the text tables from which they are quoted.

HOUSING INVENTORY

Housing units in the United States in April 1960 numbered 58,326,357. This was an increase of approximately 12.2 million units,¹ or 26 percent, over the 1950 inventory. The numerical gain was close to 1½ times the gain for the preceding decade, 1940 to 1950, when the inventory increased by 8.7 million units, or 23 percent (table A).

The net gain in the inventory is the number of units added through new construction, conversion, and other sources, minus the number lost through demolition, merger, and other means. As in previous decades, the major component of the net change was new construction. The high level of residential construction activity that was started in the postwar period of the late 1940's continued at an unprecedented rate, averaging roughly 1½ million units a year during the 1950's.

Both the increase in the number of occupied units (households) and the increase in the number of vacant units are elements of housing growth. For occupied units, the relative gain from 1950 to 1960 was only slightly higher than the gain from 1940 to 1950. For vacant units, however, the percentage gain from 1950 to 1960 was considerably higher than the gain from 1940 to 1950.

Based on occupied units only, the numerical gain in the inventory from 1950 to 1960 was the largest ever recorded. The relative gain, however, was exceeded by the relative gains in the decades prior to 1910.

Regions, divisions.—As in previous decades, the West outstripped the three other regions in the rate of housing growth. Between 1950 and 1960, the West had a 43-percent increase in housing units; whereas the South, Northeast, and North Central Regions had increases of 26 percent, 23 percent, and 22 percent, respectively (table A). Numerically, however, the South had the largest gain for the past decade.

In 1950, as in 1940, the North Central Region had the largest number of units of all the regions. By 1960, the South had the most, with 17.2 million housing units; the North Central Region and the Northeast followed closely, with 16.8 million and 14.8 million units, respectively. The West, despite its rapid growth, had the least in 1960—9.6 million units.

The rates of growth during the 1950's varied from a high of 44 percent in the Pacific Division (comprising Washington, Oregon, California, Hawaii, and Alaska) to a low of 13 percent in the East South Central Division (Kentucky, Tennessee, Alabama, and Mississippi). The Pacific Division grew the most rapidly in the preceding decade also; between 1940 and 1950, its housing inventory increased by 49 percent. For the East South Central Division, the increase for the 1940-to-1950 period was 17 percent.

For the seven other divisions, the rates of growth from 1950 to 1960 were about the same as or higher than they were from 1940 to 1950.

By 1960, the East North Central Division (comprising Ohio, Indiana, Illinois, Michigan, and Wisconsin) had the largest number of housing units of any division. The division had one-fifth of all the housing units in the Nation. The Middle Atlantic Division (New York, New Jersey, and Pennsylvania) had the second largest number. The Mountain Division (Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada), with less than 4 percent of the housing units in the Nation, had the smallest number.

Metropolitan-nonmetropolitan housing.—The large influx of households to metropolitan centers during the decade is reflected in the significant increase in the housing inventory inside standard metropolitan statistical areas (SMSA's). Approximately 36.4 million housing units, or 62 percent of the total housing units in

TABLE B.—HOUSING UNITS BY DIVISIONS, INSIDE AND OUTSIDE STANDARD METROPOLITAN STATISTICAL AREAS: 1960 AND 1950

[Occupied and vacant units. Figures for 1960 based partly on sample and essentially in agreement with complete count; figures for 1950 based on complete count. Both 1960 and 1950 figures for SMSA's relate to areas as defined for 1960. The 1960 and 1950 figures for central cities relate to cities designated central cities in 1960 but with limits as defined for the respective censuses; part of the increase "in central cities," and consequent effect on "not in central cities," is due to annexations since 1950. "Housing unit" used in 1960, "dwelling unit" in 1950]

¹ The unit of enumeration was the "dwelling unit" in 1950 and 1940 and the "housing unit" in 1960. Evidence suggests that the change in concept had relatively little effect on the counts for large areas and for the Nation (see definition of "Housing unit").

the United States, were located inside SMSA's. The 36.4 million represents a gain of 9.3 million units, or 34 percent, over the 1950 figure for comparable areas (the 1950 figures in table B having been compiled for the SMSA's as defined for 1960). The increase outside SMSA's amounted to 2.9 million units, or 15 percent (table B).

The trend toward suburban living is indicated by the sharp difference between the rates of growth for the central cities of SMSA's and for the area outside central cities. Since 1950, the gain in the central cities of the SMSA's was 3.6 million units, or 22 percent, in contrast to 5.7 million units, or 52 percent, in the metropolitan area outside the central cities. The 1950 figures for central cities in table B apply to cities designated "central cities" for the 1960 Census but with limits defined for the 1950 Census; the 1960 figures are for the same cities but with limits defined for the 1960 Census. It is estimated that roughly two-fifths of the 22-percent increase in the number of housing units in the central cities is due to annexations.²

In all divisions except the New England and Middle Atlantic, the rates of growth were much higher inside SMSA's than outside SMSA's. In the Middle Atlantic Division, the rate inside SMSA's was only slightly higher than the rate outside SMSA's; and in the New England Division, the rates were virtually the same.

In each division except the West South Central and the Mountain, the rate of growth in the central cities was lower than in the metropolitan area outside the central cities. In both divisions, much of the increase in the central cities is due to annexations.

Urban-rural and farm-nonfarm housing.—Urban housing units numbered 40.8 million and rural housing units numbered 17.6 million in 1960 (table C). The urban units were concentrated in the Middle Atlantic and East North Central Divisions, the two divisions having 43 percent of all the urban units in the United States. Rural housing units were more evenly distributed, although the number was relatively small in three of the divisions. The East North Central and South Atlantic Divisions had the largest numbers of rural units, each division having close to 19 percent of all rural units in the United States.

Data from censuses of population illustrate the long-term trend toward urbanization. In 1790, only 1 in 20 inhabitants lived in

urban territory. In every decade thereafter, except in the decade 1810 to 1820, the rate of growth of the urban population exceeded that of the rural population. By 1860, approximately 1 in 5 inhabitants was included in the urban population. The process of urbanization continued, and by 1920 the urban population had exceeded the rural population. In 1960, the urban population amounted to approximately two-thirds of the total population, and was concentrated in only slightly more than 1 percent of the total land area in the United States.

Between 1950 and 1960, urban housing increased at a much greater rate than rural housing. Urban housing in the United States increased 11.1 million units, or 37 percent; whereas rural housing increased only 1.1 million, or 7 percent. As a result, the proportion of urban housing units increased from 64 percent of all units in 1950 to 70 percent in 1960.

There were wide differences in the patterns of urban and rural growth among the geographic divisions. However, in each division, the rate of growth of urban housing exceeded that of rural housing. The East South Central and West South Central Divisions had substantial rates of growth in urban areas and actual decreases in rural areas. The East North Central, West North Central, South Atlantic, Mountain, and Pacific Divisions had increases in both the urban and rural housing; but the urban rates of increase were considerably greater than the rural. In the New England and Middle Atlantic Divisions, the urban rates of growth were below the average for the Nation as a whole and only moderately in excess of the rural rates of growth.

Of the rural units, approximately 14.0 million were classified as nonfarm and 3.6 million as farm housing units. The number of farm housing units has steadily declined during the last two decades, principally because some households have moved off the farm and others have ceased farming operations. The 1960 figures are not directly comparable with the 1950 and 1940 figures because of the change in definition of farm residence. According to other census data, the change in definition resulted in a substantial reduction of housing units in the farm housing inventory. Moreover, no vacant units were included in the 1960 count of rural-farm housing units. (The criteria used to classify farm housing units in 1960 and the impact of the change in definition are discussed in the definition of "Farm-nonfarm residence.")

About five-sixths (84 percent) of all the farm housing units were in the South and North Central Regions. The Northeast had the smallest number of farm housing units, although not much below the number for the West.

Table C.—HOUSING UNITS BY DIVISIONS, URBAN AND RURAL: 1960 AND 1950

¹ Restricted to occupied units; all vacant units in rural territory are included in the rural-nonfarm inventory.

State, county, and city growth.—Between 1950 and 1960, the number of housing units increased by more than 50 percent in five States. Alaska led the States with an increase of 103 percent. Florida was next with 86 percent, followed by Nevada (79 percent), Arizona (72 percent), and California (52 percent). States with increases between 30 and 50 percent were Hawaii; Utah; the southwestern States of Colorado, New Mexico, and Texas; and the smaller east coast States of Maryland, Delaware, New Jersey, and Connecticut (which are adjacent to Washington, D.C., Baltimore, Philadelphia, and New York City). Arkansas (2 percent), Mississippi (3 percent), and West Virginia (5 percent) were the States which had the smallest growth in housing; moreover, these three States lost population during the decade.

In 1960, New York with 5.7 million units had the largest number of housing units of any State; however, it was followed closely by California with 5.5 million housing units. Alaska with 67,000 housing units in 1960 had the smallest number even though the count of units more than doubled during the 1950's.

Rates of growth are illustrated in figure 5 for the decade 1950 to 1960 and in figure 6 for the decade 1940 to 1950. The four States with increases of 50 percent or more from 1940 to 1950 (Florida, Arizona, California, and Nevada) also were among the States with the highest increases from 1950 to 1960. Of the five States with increases under 10 percent for 1940 to 1950 (Mississippi, Montana, North Dakota, South Dakota, and Nebraska), Mississippi was the only State with an increase under 10 percent for 1950 to 1960 also.

In about two-thirds of the States, the increases from 1940 to 1950 were lower than or about the same as the increases from 1950 to 1960. Among the States with the greatest differences in the rates for the two decades were Alaska, Nevada, Florida, and Delaware. The rates of increase for Alaska were 35 percent from 1940 to 1950 and 103 percent from 1950 to 1960; for Nevada, the corresponding percentages were 53 and 79; for Florida, 61 and 86; and for Delaware, 28 and 48.

In the remaining one-third of the States, the percentage gains from 1940 to 1950 were higher than those from 1950 to 1960. Among the States with the greatest differences in the rates for the two decades were Oregon, Washington, and West Virginia. The increases for Oregon were 41 percent from 1940 to 1950 and 18 percent from 1950 to 1960; for Washington, the corresponding percentages were 37 and 24; and for West Virginia, the corresponding percentages were 18 and 5.

In 1960, there were 3,134 counties and county equivalents in the United States. Growth in the housing inventory between 1950 and 1960 in relation to the growth between 1940 and 1950 in each county is illustrated in figure 7. Approximately two-thirds (68 percent) of the counties had increases in the number of units from 1940 to 1950 as well as from 1950 to 1960. In contrast, 13 percent had decreases in both periods. About 12 percent of the counties had decreases from 1940 to 1950 but increases from 1950 to 1960; and the remaining 7 percent had increases from 1940 to 1950 but decreases from 1950 to 1960.

Virtually all the counties in the Northeast had increases in the number of units for both decades, as compared with 71 percent in the North Central Region, 65 percent in the West, and 61 percent in the South. On the other hand, approximately one-third of the counties in the South had decreases in both decades. In the North Central Region and in the West, about one-fifth of the counties had decreases in both decades.

Of the 51 cities with a population of 250,000 or more, the counts of housing units increased during the 1950's in all except St. Louis, where there was a negligible loss (table D). Increases occurred despite population losses in a number of the cities.

The increases in the number of units from 1950 to 1960 exceeded 100 percent in three cities: Phoenix (282 percent), Tampa (134 percent), and El Paso (121 percent). In seven others, the increases were between 50 and 100 percent. Each of the 10 cities

had annexations between 1950 and 1960; for most of them, the annexations accounted for a substantial part of the increase in the housing inventory. (Figures in table D relate to the city limits as defined for the respective censuses.) At the other end of the scale, there were 16 cities with increases under 10 percent—the lowest being Pittsburgh, with 1.2 percent.

In 29 of the 51 cities, the housing inventory grew less rapidly from 1950 to 1960 than in the preceding 10 years. For some cities, the differences in the rates of growth were substantial—Fort Worth, for example, increased 40 percent from 1950 to 1960 in contrast to 64 percent from 1940 to 1950.

The cities in table D are ranked by population size and do not necessarily follow the ranking by number of housing units. For the first five cities, the ranking by population and by the number of housing units is the same. The five cities next in order, when ranked by number of housing units, are Houston, San Francisco, Baltimore, Cleveland, and St. Louis. Among the cities with major differences in the ranking are Kansas City and Miami. Kansas City ranks 27th according to population size but 19th according to the number of housing units, and Miami ranks 44th according to population but 36th according to housing.

TABLE D.—CHANGE IN NUMBER OF HOUSING UNITS AND TOTAL POPULATION, 1940 TO 1960, FOR CITIES OF 250,000 INHABITANTS OR MORE IN 1960

[Ranked by population size. Figures for 1960 housing units based partly on sample and essentially in agreement with complete count; remaining figures based on complete count. Figures relate to city limits as defined for the respective censuses. Percent not shown where less than 0.1]

Figure 5.—PERCENT INCREASE IN TOTAL HOUSING UNITS, FOR STATES: 1950 TO 1960

Figure 6.—PERCENT INCREASE IN TOTAL DWELLING UNITS, FOR STATES: 1940 TO 1950

Figure 7.—TREND IN NUMBER OF HOUSING UNITS, FOR COUNTIES: 1940 TO 1960

Components of inventory change.—The difference between 1950 and 1960 counts of units represents the net change in the housing inventory for the period. An analysis of the components of change between the two censuses is provided by the December 1959 Components of Inventory Change survey which is part of the 1960 Census of Housing. Results of this survey, which are based on a sample of approximately 180,000 dwelling units, are summarized in table E.

The net gain of 12.3 million dwelling units in the United States from 1950 to 1959 resulted from the addition of about 16.9 million units and the loss of about 4.5 million units. Thus, for roughly every four units added to the inventory, one unit of the existing supply was removed.

TABLE E.—COMPONENTS OF CHANGE IN THE HOUSING INVENTORY, 1950 TO 1959

[Based on sample; see 1960 Census of Housing, Volume IV, Components of Inventory Change, Part 1A. Figures for SMSA's relate to areas defined as of June 8, 1959]

Component of change	United States	Inside SMSA's			Outside SMSA's
		Total	In central cities	Not in central cities	
Dwelling units, Apr. 1950...	46,137,000	26,418,000	16,188,000	10,230,000	19,719,000
Net change, 1950 to 1959...	12,331,000	8,681,000	2,581,000	6,100,000	3,650,000
Units added through—					
Conversion (net gain).....	807,000	541,000	366,000	175,000	266,000
New construction.....	15,003,000	9,827,000	3,420,000	6,408,000	5,176,000
Other sources.....	1,050,000	497,000	274,000	223,000	554,000
Units lost through—					
Merger (net loss).....	815,000	498,000	348,000	150,000	317,000
Demolition.....	1,933,000	1,010,000	758,000	252,000	923,000
Other means.....	1,783,000	676,000	373,000	303,000	1,107,000
Dwelling units, Dec. 1959...	58,468,000	35,099,000	18,769,000	16,330,000	23,369,000

New construction was the source of the largest number of additions. In the December 1959 inventory, there were approximately 15.0 million dwelling units which had been built between April 1950 (the date of the 1950 Census) and December 1959.³ The new units amounted to roughly one-fourth of the 1959 inventory. About 1.1 million dwelling units, or 1.8 percent of the 1959 inventory, had been added through "other sources" (units moved to site and units created from nonresidential space, rooming houses, or transient accommodations). A gain of approximately 807,000 units, or 1.4 percent of the 1959 inventory, resulted from conversion, which is the creation of two or more units from fewer units through structural alteration or change in use.

On the other hand, an estimated 1.9 million units of the 1950 inventory had been demolished and approximately 1.8 million were lost through "other means." The latter includes units destroyed by fire or flood; units which had become unfit for human habitation; units changed to nonresidential use, rooming houses, or transient accommodations; and units moved from site. Losses through demolition and "other means" amounted to 8.1 percent of the 1950 inventory. The loss from mergers (the result of combining two or more units into fewer units through structural alteration or change in use) amounted to 815,000 units.

About seven-tenths of the net gain in the housing inventory was inside SMSA's. Approximately 10.9 million units had been added to the inventory inside SMSA's while 2.2 million were lost from the inventory. Most of the losses inside SMSA's occurred in the central cities, while most of the

additions occurred outside the central cities. Outside SMSA's, approximately 6.0 million units had been added to the inventory and 2.3 million units lost.

There are several differences between the December 1959 survey and the April 1960 Census. The "dwelling unit" concept was used in December 1959 and the "housing unit" concept in April 1960. New construction in the 1959 survey was identified by direct comparison with the 1950 Census records and the information on year built; new construction was measured from April 1950 through December 1959. New units in the April 1960 Census, identified solely on the basis of year built, consist of those built in the period from January 1950 through March 1960. Other differences between the December 1959 survey and the April 1960 Census include: The use of a sample of land area segments in 1959 in contrast to the 100-percent coverage for some items and a systematic sample of housing units for others in 1960, and the extensive use of self-enumeration in 1960 in contrast to direct interview and the use of the 1950 records in the 1959 survey. Furthermore, there are some differences between 1959 and 1960 in the number of standard metropolitan statistical areas and their boundaries, the SMSA's and central cities for the December 1959 survey having been defined as of June 8, 1959. (More detailed information on the changes between 1950 and 1959 is provided in Volume IV of the 1960 Housing reports, Part 1A.)

OCCUPANCY CHARACTERISTICS

Occupied units and population.—Between 1950 and 1960, the number of occupied units (households) increased from 43.0 million to 53.0 million. The increase of approximately 10.0 million units is the largest numerical increase ever recorded between successive censuses (table F). The relative increase, a little over 23 percent, was slightly greater than the increase from 1940 to 1950 and greater than any of the increases for several preceding decades. However, it was smaller than the 27-percent increase between

FIGURE 8.—INCREASE IN OCCUPIED HOUSING UNITS AND POPULATION, TOTAL AND NONWHITE, FOR THE UNITED STATES: 1890 TO 1960

U. S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

³ The figure of 15.0 million new dwelling units in the 1959 survey and the figure of 16.0 million new housing units (built January 1950 to March 1960) in the April 1960 Census are within sampling error after allowance is made for differences in time period and unit of enumeration. The 1950 concept of "dwelling unit" was retained for the 1959 survey so that changes since 1950 could be measured on a unit-by-unit basis. The differences are discussed in Volume IV of the 1960 Housing reports, Part 1A.

1900 and 1910 during the peak of the European immigration and smaller than the increases during the latter half of the nineteenth century, when the average was about 35 percent per decade. Statistics on the number of occupied units, although identified as families or private families in the earlier censuses, are essentially comparable for the series.

The number of occupied units increased more rapidly than population, continuing a trend observed for some time. The 23-percent increase in the number of occupied units from 1950 to 1960 exceeded the 19-percent increase in total population for the same period. Differences between the growth in total occupied units and total population were even greater for preceding decades. For nonwhites, however, growth in population exceeded growth in households for the period 1940 to 1950 (table F and figure 8).

The difference in the growth of occupied units and population is reflected in the decline in household size. Population per

occupied unit decreased steadily from 4.8 persons in 1900 to 3.4 persons in 1960. The decrease is attributable to a number of factors. A major factor was the decline in the birth rate up to 1940. More recently, there has been an increase in the number of individuals who maintain their own households and a decrease in the number of married couples who share the living quarters of others.⁴

Occupancy by color.—Between 1950 and 1960, the number of nonwhite households increased at a faster rate than white households. The number of occupied units with nonwhite household heads increased from 3.9 million to 5.1 million, or 33 percent; the number of units with white household heads increased from 39.1 million to 47.9 million, or 22 percent. The increase in nonwhite households was entirely within SMSA's, mostly in the central cities; outside SMSA's, there was a slight decrease. The increase in white households also was concentrated inside SMSA's, but largely outside the central cities (table G).

In 1950, approximately 1 in 11 occupied units in the United States (9.0 percent) was occupied by a household with nonwhite head. In 1960, the ratio was approximately 1 in 10 (9.7 percent). All but a small proportion of these units were occupied by households with Negro heads.

The South continued to have the largest proportion of units with nonwhite households, although the ratio decreased from one-fifth (20 percent) in 1950 to about one-sixth (18 percent) in 1960. The proportions in each of the three other regions increased during the decade—from 4 to 6 percent in the North Central Region and from 5 to 7 percent in the Northeast and in the West.

Of the total number of units with nonwhite households in the United States, about two-thirds (64 percent) were in the South in 1950 and a little over half (54 percent) in 1960. The smallest proportion of the United States total was in the West—8 percent in 1950 and 11 percent in 1960.

Historical data for conterminous United States indicate that the higher rate of increase in nonwhite households during the 1950's, compared with white households, was a reversal of the trend that was evident earlier. For several decades prior to 1950, the rates of increase in the number of nonwhite households lagged far behind the rates of increase in the number of white households (table F). The pattern of population growth was somewhat different. Prior to 1940, the white population grew faster than the nonwhite population. From 1940 to 1960, the situation was reversed—the nonwhite population grew faster than the white population. The lowering of mortality combined with higher birth rates among the nonwhites were paramount among the reasons for the increased growth of the nonwhite population.

Population per occupied unit for both white and nonwhite households decreased steadily since 1890, except for the decade 1940 to 1950 when the average for nonwhite households showed an increase over the preceding decade. Population per occupied unit in conterminous United States decreased from 4.9 in 1890 to 3.3 in 1960 for white households and from 5.5 to 4.0 for nonwhite households. For white and nonwhite households combined, the average decreased from 5.0 in 1890 to 3.4 in 1960. (In table F, total population was used in the computation to provide consistency in the series; in the detailed tables, population in housing units was used in the computation.)

Homeownership vs. renting.—Homeownership in 1960 was at the highest level of any census year for the period beginning with 1890, when information on tenure was first collected by the Bureau of the Census. Approximately 32.8 million housing units were occupied by their owners in 1960, representing 62 percent of all occupied units. The numerical gain of 9.2 million over the 23.6 million owner-occupied units in 1950 was the largest for any decade (table H). The relative gain, however, was second to the gain

TABLE F.—OCCUPIED HOUSING UNITS AND POPULATION, BY COLOR OF HOUSEHOLD HEAD, 1890 TO 1960, AND BY RESIDENCE, 1960 AND 1950

¹ Statistics on the number of occupied units are essentially comparable for the series although identified by various terms; the term "occupied housing unit" applies to figures for 1960, "occupied dwelling unit" for 1950 and 1940, and "family" for 1930 and earlier. Counts for 1930 and 1900 represent private families only; counts for 1920, 1910, and 1890 include the small number of quasi-family groups which were counted as families in those years. (See definition of "housing unit" and "occupied housing unit.")

² Includes the population in group quarters or in quasi-family groups.

³ Total population divided by the number of occupied units. Total population was used in the computation of each of the averages to provide consistency (counts excluding the population in group quarters or quasi-family groups are not available for each census year).

⁴ Tabulated only for the Southern States.

⁴ Data from chapters B and C of 1960 Census of Population, Volume I, Characteristics of the Population.

between 1940 and 1950. The number of owner-occupied units in 1960 was about 1½ times the number in 1950, which in turn was over 1½ times the number in 1940.

The trend in the rate of owner occupancy is illustrated by figure 9. Homeownership was at the high rate of 48 percent back in 1890 but declined slowly to 46 percent in 1920. The rate increased during the 1920's, and by 1930 had regained its 1890 level. Affected by the depression of the 1930's, homeownership dropped to a low of 44 percent in 1940. The rise in the level of income in the 1940's and 1950's, the high rate of new construction, and liberalized home-financing terms were among the factors which contributed to the sharp rise to 55 percent in 1950, then to 62 percent in 1960.

TABLE G.—COLOR OF HOUSEHOLD HEAD AND TENURE OF UNIT: 1960 AND 1950

[Figures for 1960 based on sample and essentially in agreement with complete count; figures for 1950 based on complete count. Both 1960 and 1950 figures for SMSA's relate to areas as defined for 1960. The 1960 and 1950 figures for central cities relate to cities designated central cities in 1960 but with limits as defined for the respective censuses; part of the increase "in central cities," and consequent effect on "not in central cities," is due to annexations since 1950. Minus sign (—) denotes decrease]

¹ Not available for all SMSA's.

The rates for renter occupancy produced the reverse pattern. The proportion of renter-occupied units rose slowly from 52 percent in 1890 to 54 percent in 1920, dropped to 52 percent in 1930, and increased to its highest level in 1940. This was followed by a sharp decrease in the last two decades, with the renter occupancy rate reaching a low of 38 percent in 1960.

Compared with the gain in owner-occupied units between 1950 and 1960, the increase of 872,000 renter-occupied units was relatively small. Numerically, it was the smallest gain recorded for any decade—not counting the period 1940 to 1950, when there was a slight decrease in the number of renter-occupied units.

The North Central Region, with 67 percent, had the highest rate of owner occupancy in 1960; and the Northeast, with 56 percent, had the lowest of the four regions (table 1). The rate for the South was 62 percent and for the West, 61 percent. The North Central Region had the highest and the Northeast had the lowest rates in 1950 and 1940 also.

In only three States—Hawaii, New York, and Alaska—and in the District of Columbia, were there more renters than homeowners. The owner occupancy rates were 41 percent, 45 percent, and 48 percent for the respective States and 30 percent for the District of Columbia (table 3). States with the highest owner occupancy rates were: Michigan (74 percent), Minnesota (72

¹ See table F, footnote 1.

² Tabulated only for the Southern States.

percent), Utah (72 percent), Indiana (71 percent), and Idaho (71 percent). California, with 2.9 million units occupied by their owners, led all the States in the number of owner-occupied units. New York, with 2.9 million units occupied by renters, led the States in the number of renter-occupied units.

Homeownership was more prevalent outside SMSA's than inside SMSA's. Approximately 2 out of 3 occupied units (67 percent) outside SMSA's and 3 out of 5 (59 percent) inside SMSA's were occupied by their owners. Inside SMSA's, the rate in the area outside central cities (73 percent) was substantially higher than the rate inside central cities (47 percent); it was also higher than the rate outside SMSA's. The pattern was the same in 1950—the lowest rate of owner occupancy was in the central cities and the highest was in the metropolitan territory outside central cities (table G).

During the 1950's, homeownership grew most rapidly in the portion of SMSA's outside the central cities. The growth was consistent with the large amount of new construction in these areas. Owner-occupied units increased 4.6 million, or 70 percent, in the portion of SMSA's outside central cities; 2.1 million, or 32 percent, in central cities; and 2.4 million, or 23 percent, outside SMSA's.

The number of renter-occupied units inside SMSA's also increased since 1950, although they represented a smaller proportion of the occupied units in 1960 than in 1950. In central cities, the number increased 784,000, or 9 percent; in the portion of SMSA's outside central cities, the number increased 593,000, or 16 percent. The number of renter-occupied units outside SMSA's, however, decreased by 505,000, or 7 percent.

Homeownership was more common among white than nonwhite households in 1960. However, the rate of increase since 1950 was greater for nonwhite than for white homeowners. Between 1950 and 1960, the number of units occupied by nonwhite owners increased from 1.4 million to 2.0 million, or 46 percent; whereas the number occupied by white owners increased from 22.3 million to 30.8 million, or 38 percent. By 1960, approximately 3 out of 8 nonwhite households, compared with 5 out of 8 white households, owned their homes.

Homeownership among nonwhites was highest in the West, where the rate was 45 percent, and lowest in the Northeast, where it was 27 percent. Of the States, New Mexico with 67 percent had the highest rate of homeownership among nonwhites and New York with 17 percent had the lowest (table 22).

There was a greater increase in the number of units occupied by nonwhite renters than in the number occupied by white renters. During the 1950's, the increase in the number of nonwhite renter households was about 26 percent; in contrast, the increase in white renter households was only a little more than 1 percent.

The large number of units built between 1950 and 1960 was an important source of increase for both owner-occupied and renter-occupied inventories. Another part of the increase resulted from changes in occupancy during the decade—for example, from renter to owner and from white to nonwhite occupancy. Conversions, mergers, demolitions, and other additions and losses also contributed to the net increase in owner-occupied and renter-occupied units.⁵

Persons and persons per room.—On the average, households have become smaller; however, there are indications of a slowing down of the trend in this direction. The median number of persons in occupied housing units was 3.0 in 1960, as compared with 3.1 in 1950 and 3.3 in 1940.

From 1940 to 1950, there was a distinct upward trend in the number of units with 1, 2, 3, and 4 persons and a downward trend in the number of units with 5, 6, 7, and 8 or more persons (as indicated by the percentage distributions in figure 10). In com-

FIGURE 10.—NUMBER OF PERSONS IN THE UNIT, FOR THE UNITED STATES: 1940 TO 1960

parison with 1950, there were relatively more units in 1960 with 1, 5, and 6 persons; relatively fewer units with 3, 4, and 8 or more persons; and the same proportions with 2 and 7 persons. In all three census years, 2-person households were the most common; however, 1-person households showed the sharpest growth over the 20-year period.

In 1960, there were 7.1 million units (13 percent) occupied by 1-person households and 14.9 million (28 percent) occupied by 2-person households (table J). According to data in Volume VII of the 1960 Housing reports, over half (53 percent) of the 1-person households were persons 60 years old or over. Furthermore, nearly half (47 percent) of the 2-person households were households in which one or both persons were 60 or over.

Households were smaller inside SMSA's than outside SMSA's; the medians were 2.9 and 3.0 persons, respectively. Within SMSA's, the median household size was 2.6 persons in the central cities and 3.2 persons outside central cities (table 2).

The South, with a median of 3.1 persons, had the largest households of the regions; whereas the West, with a median of 2.8 persons, had the smallest households. For the Northeast and North Central Regions, the medians were the same—2.9 persons (table 2).

For the Nation as a whole, owner households were appreciably larger than renter households; the medians were 3.1 and 2.6 persons, respectively. In comparison with 1950, there was a greater decrease in the size of renter households than owner households (table J).

Data on persons per room provide a rough measure of the utilization of space in the housing unit. The ratio assumes an

⁵ Additional data on changes in tenure are provided in Volume IV of the 1960 Housing reports, Part 1A.

¹ Exclusion of Alaska and Hawaii amounts to about 109,000 occupied units.

equal distribution of persons and rooms without regard for the size and type of rooms or the age, sex, and relationship of the occupants. On the basis of persons per room, housing units on the average were less crowded in 1960 than they were in 1950 or in 1940. About 12 percent of the occupied units in 1960 had 1.01 or more persons per room, compared with 16 percent in 1950 and 20 percent in 1940 (table J). Inside SMSA's, 10 percent of the occupied units averaged more than one person to a room in 1960; outside SMSA's, the proportion was 14 percent.

On the average, there was less crowding in owner-occupied units than in renter-occupied units. Roughly 1 in 12 owner-occupied units, compared with 1 in 6 renter-occupied units, had more than one person per room (table 6).

Year moved into unit.—At the time of the census in 1960, more than one-fifth (22 percent) of the households had moved into their present units during the preceding 1½ years (January 1959 to March 1960). Approximately half (48 percent) the households had moved into their units during the period from January 1950 through December 1958. Thus, about seven-tenths of the households in 1960 had been living in their present units for less than 10½ years. About one-sixth (17 percent) of the households had lived in their present units from 10 to 20 years and one-eighth (13 percent) had occupied the same units for more than 20 years (table K).

There were marked differences among the regions in the length of time households had been occupying their present units. Approximately 30 percent of the households in the West in 1960 had been living in their present units for 1½ years or less (table 6). In contrast, 16 percent of the households in the Northeast, 20 percent in the North Central Region, and 25 percent in the South in 1960 had been living in their units for only a short period. On

the other hand, only 8 percent of the households in the West in 1960 had been living in their present units for more than 20 years; corresponding proportions for the other regions were 17 percent for the Northeast, 15 percent for the North Central Region, and 12 percent for the South.

Owner households remained in their present units for a longer period than renter households. As indicated in figure 11, about 18 percent of the owner households, in contrast to 6 percent of the renter households, had lived in the same units for over 20 years. On the other hand, only 12 percent of the owner households, but 38 percent of the renter households, had lived in their units for 1½ years or less.

FIGURE 11.—YEAR HOUSEHOLD HEAD MOVED INTO UNIT BY TENURE, FOR THE UNITED STATES, INSIDE AND OUTSIDE STANDARD METROPOLITAN STATISTICAL AREAS: 1960

The proportion of owner households that occupied their present quarters for over 20 years was larger outside SMSA's than inside SMSA's; in turn, the proportion of such households was higher in central cities than in the metropolitan area outside central cities. For renter households, the proportion that had lived in the same units for at least 20 years was higher in central cities of SMSA's than it was outside central cities or in the territory outside SMSA's.

The proportion of owner households that had recently moved into their units (during the 1½ years preceding the census) was higher in the metropolitan areas outside the central cities than in the central cities or outside SMSA's. The same pattern applies to renter households.

The statistics on the year the household moved into the unit are based on the date the head moved into the unit. They roughly reflect turnover of occupancy for households living in an area in 1960; they do not indicate, for example, the proportion that moved into or out of an area.⁶

Vacancy situation.—An important element of the housing inventory is the stock of vacant housing units. In 1960, there were 5.3 million vacant units of all types, representing 9.1 percent of the total housing units in the United States. Of these vacancies, about 522,000, or 0.9 percent of the total inventory, were available for sale only and about 1.5 million, or 2.5 percent of the total inventory, were available for rent. (Available vacant units are units for year-round occupancy, are in sound or deteriorating condition, and are offered for sale or for rent.) The remaining 3.3 million vacant units include units intended for seasonal occupancy, units in dilapidated condition, and units held off the market for other reasons (table L).

Compared with 1950, the number of vacant units has increased substantially, particularly the supply of available vacancies. In 1950, there were approximately 3.2 million vacant units of all types, amounting to 6.9 percent of the total housing inventory. About 216,000 vacant units, or 0.5 percent of the total inventory, were available for sale only and about 520,000, or 1.1 percent of the total inventory, were available for rent.

Available vacant units constitute the supply of vacant units on the sale or rental market. The for-sale and for-rent rates based on the total inventory indicate the level of the total available supply; rates based on the homeowner and rental inventories, however, more adequately describe the separate sale and rental markets. The homeowner vacancy rate is the percentage relationship between vacant units available for sale and the total homeowner inventory (which consists of the owner-occupied units and the vacant units available for sale). Similarly, the rental vacancy rate is the percentage relationship between vacant units available for rent and the total rental inventory (which consists of the renter-occupied units and vacant units available for rent). The homeowner vacancy rate in 1960 was 1.6 percent; that is, 1.6 percent of the homeowner inventory was vacant and available for sale. The rental vacancy rate was 6.7 percent; that is, 6.7 percent of the rental inventory was vacant and available for rent. These rates are substantially higher than the respective rates of 0.9 and 2.6 percent in 1950, indicating an easing of the relatively tight supply of available housing in 1950.

Both the homeowner and rental vacancy rates varied considerably by region (table 1). Moreover, the Northeast with the lowest homeowner vacancy rate (1.2 percent) also had the lowest rental vacancy rate (4.2 percent). On the other hand, the West with the highest homeowner vacancy rate (2.0 percent) also had the highest rental vacancy rate (8.8 percent). The North Central Region had the second lowest rates (homeowner vacancy rate of 1.3 percent and rental vacancy rate of 6.7 percent) and the South had the second highest rates (homeowner vacancy rate of 1.8 percent and rental vacancy rate of 8.0 percent).

TABLE L.—VACANT HOUSING UNITS, BY CONDITION AND STATUS: 1960 AND 1950

¹ Units in the category "nonresident" (those temporarily occupied by persons with usual residence elsewhere) were distributed among seasonal units, dilapidated units, and units held off the market.

The homeowner vacancy rate was higher inside SMSA's of the United States than outside SMSA's. The rental vacancy rate, however, was lower inside than outside SMSA's (table L). Inside SMSA's, both the homeowner and rental rates were lower in the central cities than in the portion outside the central cities.

Rates for individual SMSA's varied considerably. The homeowner and rental vacancy rates for the 24 SMSA's with a population of 1,000,000 or more in 1960, and their respective central cities, are illustrated in figure 12. In all 24 SMSA's, the homeowner rate for the central city (or cities) was about the same as or lower than the rate for the entire SMSA. A different pattern emerges for the rental vacancy rates, however; for half the areas, the rate for the central city (cities) was higher than the rate for the entire SMSA. The San Diego SMSA had the highest homeowner vacancy rate (4.0 percent) and the Paterson-Clifton-Passaic SMSA had the lowest (0.8 percent). The Houston SMSA had the highest rental vacancy rate (14.1 percent) and the New York SMSA had the lowest (2.4 percent).

In 7 of the 24 SMSA's (San Diego, Houston, Dallas, Atlanta, Kansas City, Washington, D.C.-Md.-Va., and Baltimore) the homeowner vacancy rate exceeded the average of 1.7 percent for all SMSA's in the United States. In 8 SMSA's (Houston, San Diego, Seattle, Detroit, Dallas, Kansas City, Los Angeles-Long Beach, and San Francisco-Oakland), the rental vacancy rate exceeded the average of 6.4 percent for all SMSA's in the United States.

The homeowner and rental vacancy rates describe the market conditions of vacancies available for sale or rent. In the analysis of the total vacancy situation, consideration should be given to vacant units not on the available market. These include units intended for seasonal occupancy, dilapidated units, units already rented or sold and awaiting occupancy, and units held for occa-

⁶ Statistics on previous residence of recent movers are provided in Volume IV of the 1960 Housing reports, Part 1B.

sional use or other reasons. The combined total of vacant units not on the available sale or rental market in the United States was 3.3 million units, which represented 5.7 percent of the total inventory.

FIGURE 12.—HOMEOWNER AND RENTAL VACANCY RATES, FOR STANDARD METROPOLITAN STATISTICAL AREAS OF 1,000,000 INHABITANTS OR MORE AND CENTRAL CITIES: 1960

[Ranked by population size]

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

Seasonal units constituted the major portion of vacant units not on the market for sale or for rent. Most of the seasonal vacancies were vacation homes used for summer or winter recreation; others were cabins and houses reserved for loggers, herders, or migratory farmworkers who would occupy the quarters during the periods of employment. In 1960, there were 1.7 million vacant units (3.0 percent of the total inventory) intended for seasonal occupancy. Approximately three-fourths of these units were located outside SMSA's, and about three-eighths were in the Northeast. In 1950, the number of seasonal vacancies was about 1.1 million.

Dilapidated vacancies in 1960 amounted to 501,000 units (0.9 percent of the total inventory). Two-thirds of the dilapidated vacant units were located outside SMSA's. Dilapidated vacant units were included in the housing inventory provided they were still usable as living quarters; they were excluded if they were unfit for human habitation. In comparison with 1950, there was a slight decrease in the number of dilapidated vacancies.

About 1.1 million vacant units (1.9 percent of the total inventory) were for year-round occupancy and were not dilapidated, but were held off the sale or rental market. Of this group, approximately 235,000 units had been rented or sold but not yet occupied. About two-fifths of the vacancies that had been rented or sold were located inside SMSA's but outside the central cities. Although these units were not part of the available market, they reflect that part of the supply which had been "spoken for." About 282,000 vacant units, two-thirds of which were outside SMSA's, were being held for occasional use. These were units reserved by their owners for weekend or other occasional use during the year. Units of this type are sometimes referred to as "second homes." It is possible that some units held for occasional use were included with the seasonal group because of the difficulty of distinguishing between the two categories. The remaining 567,000 vacant units were held off the market for personal reasons of the owner, settlement of estate, use by a caretaker or janitor, and other reasons.

STRUCTURAL CHARACTERISTICS

Age of structure.—One of the significant factors affecting the distribution of housing units by age of structure has been the amount of new construction in recent years. The high rate of residential construction in the postwar period of the late 1940's continued through the 1950's. By 1960, the proportion of the housing inventory that was less than 10 years old was substantial. Approximately 16.0 million housing units in the United States, amounting to over one-fourth (28 percent) of the 1960 inventory, were in structures built in the last 10 years (table M). In 1950, about one-fifth (21 percent) of the units had been built during the 10 years prior to the census. The proportion of new units in 1940 was close to one-sixth (16 percent), reflecting in part the relatively low building level during the depression of the early 1930's.

Despite the large number of new units in 1960, almost half the housing units in the inventory (47 percent) were more than 30 years old. This represents about the same proportion of older units as in 1950 (46 percent) but an increase since 1940 (when the proportion was 41 percent).

Consistent with the trend to metropolitan living, approximately two-thirds of the new units (10.8 million of the 16.0 million) were inside SMSA's; in turn, approximately two-thirds of the new units inside SMSA's were located outside the central cities (table 11). About 70 percent of all the new units in 1960 were occupied by their owners, about 20 percent were occupied by renters,⁷ and the remainder were vacant.

The figure of 16.0 million for new units existing in 1960 is not the accumulated number of units built during the 1950's; it represents the number of units constructed during the 1950's, plus the number created by conversion minus the number lost in structures originally built during the 1950's. Estimates based on

⁷ Table 3 in Volume II of the 1960 Housing reports.

Figure 13.—HOUSING UNITS IN STRUCTURES BUILT IN 1950 OR LATER, FOR DIVISIONS: 1960

Figure 14.—HOUSING UNITS IN STRUCTURES BUILT IN 1950 OR LATER, FOR STATES: 1960

Figure 15.—HOUSING UNITS IN STRUCTURES BUILT IN 1950 OR LATER, FOR COUNTIES: 1960

other census data indicate that the number of conversions and losses among new units is relatively very small.⁸ The 16.0 million figure is not the same as the net increase between 1950 and 1960, which amounted to 12.2 million units. The 3.8 million difference (with some allowance for units built in the period January to March 1950) represents the net loss of units in structures built prior to 1950; that is, there were roughly 3.8 million more units lost to the supply than were gained through conversion or other means. (See also section on "Components of Inventory Change.")

The distribution of new housing by geographic divisions is illustrated by figure 13. The bar chart shows the number of new units in each division, and the circle chart shows the division's proportionate share of new housing in the entire Nation. Three divisions account for more than half of all the new housing. They are the East North Central, the South Atlantic, and the Pacific Divisions—each with approximately 2¾ million new units. Two

¹ Exclusion of Alaska and Hawaii amounts to approximately 113,000 units (see table A, footnote 2).

² 1960 and 1950 figures include occupied trailers; 1940 figure includes "other dwelling place."

³ Category not comparable with 1960 category.

⁸ Estimates based on data in Volume IV of the 1960 Housing reports, Part 2.

other divisions, the Middle Atlantic and the West South Central, account for about one-fourth of all the new units, and the four remaining divisions account for the balance.

A different kind of distribution for the divisions is obtained when the new units are related to the total housing units in the respective divisions. The Pacific and Mountain Divisions rank first, with about 37 percent of their housing units having been built during the 1950's. The three divisions in the South had the next highest proportions of new units, followed by the two divisions constituting the North Central Region. The New England and Middle Atlantic Divisions, each with about 20 percent, had the lowest proportions of new units (table 1).

For individual States, the percentage of new units varied widely (figure 14). Six States had proportions of 40 percent or more; Alaska (55 percent), Florida (52 percent), Arizona (51 percent), Nevada (48 percent), New Mexico (43 percent), and California (40 percent). There were 10 States with proportions ranging from 30 to 39 percent, and 23 States with proportions from 20 to 29 percent. In the remaining States (New York, South Dakota, Pennsylvania, Nebraska, Massachusetts, Rhode Island, New Hampshire, West Virginia, Iowa, Maine, and Vermont) and in the District of Columbia, the proportions of new units were below 20 percent—the lowest being 14 percent in Vermont.

Another aspect of the amount of new housing, not revealed by percentage figures, concerns the large numbers of new units in States which already had large housing inventories. For example, New York State had 1.1 million new units, although the proportion amounted to only one-fifth of the 5.7 million housing units in the State. Other States with large numbers of new units but which fall below the 30-percent level of new housing units are Ohio with approximately 0.8 million and Illinois, Michigan, and Pennsylvania each with approximately 0.7 million new units. The numbers of new units were large also in California, Texas, and Florida, but they represented relatively high percentages of the total housing units in these States (table 5).

Data for individual counties, on the proportion of new units to the total units in the county, are shown in figure 15. For approximately 1 in 5 counties, the proportion of new units was 30 percent or more. On the other hand, only 1 in 100 counties had a proportion of 5 percent or less.

Units in structure, basement, elevator in structure.—The stock of 1-unit detached structures increased much faster between 1950 and 1960 than the inventory as a whole. While the total inventory of housing units increased about 26 percent, the number of 1-unit detached structures increased 39 percent, bringing the total number of such units to 40.9 million (table M). Thus, about 7 out of 10 units in the United States in 1960 were 1-unit detached houses. An additional 6 percent were 1-unit attached structures—the row houses and semidetached houses found in some localities. The aggregate of 1-unit structures, therefore, represented 76 percent of the total housing units in 1960, indicating a strong preference on the part of the American household to live in a single-unit structure. About 8 percent of all housing units were in structures with 2 units, 5 percent were in structures with 3 or 4 units, and the remaining 11 percent were in structures with 5 or more units (table 11). Compared with 1950 and 1940, the proportion of units in 5-or-more-unit structures in 1960 was practically the same; the proportion of units in 1-unit detached structures, however, was higher in 1960 than in 1950 or 1940 (table M).

Owner-occupied units were predominantly in 1-unit structures (table 11). Over nine-tenths of the owner-occupied units were in 1-unit structures and most of the remainder (exclusive of trailers) were in structures with only 2 units. Of the renter-occupied units, about half were in 1-unit structures and one-fourth were in structures with 5 or more units. Units in multiunit structures, both owner occupied and renter occupied, were found primarily in urban areas.

TABLE N.—BASEMENT IN STRUCTURE AND NUMBER OF BEDROOMS: 1960

[Based on sample]

Subject	United States		Inside SMSA's		Outside SMSA's

Approximately 767,000 trailers occupied as housing units were included in the housing inventory in 1960 (table 11). Mobile trailers were included, as well as trailers on permanent foundations. Most of the trailers in 1960 (about nine-tenths) were occupied by their owners. There were roughly the same number of trailers in urban as in rural areas, and about the same number inside as outside SMSA's. However, there were very few trailers in the central cities of SMSA's.

More than half of all housing units in 1960, 54 percent, were in structures with a basement (table N). A small proportion, 13 percent, were in structures built on a concrete slab. The remaining 33 percent, classified as "other," were in structures built on foundations with only crawl space or in structures resting on supports or directly on the ground. In urban centers (central cities of SMSA's), approximately two-thirds of the units were in structures with a basement. The figures in the category "basement" do not represent the number of basements in residential structures, inasmuch as some structures have more than one housing unit but only one basement.

Regional differences in the type of construction are striking. In the Northeast, 89 percent of the units were in structures with a basement; in the North Central Region, this proportion was 74 percent. In the South, most of the units, 62 percent, were in the "other" category and only 19 percent were in structures with a basement. In the West, about half the units were in the "other" category and 27 percent were in structures with a basement. Of the four regions, the West had the highest proportion of units in structures built on a concrete slab—24 percent (table 5).

Information on elevator in structure (as well as information on basements, discussed above) was first collected in a housing census in 1960. The description of the structure as walkup or elevator type, however, was limited to housing units in large cities and further limited to housing units in structures with four floors or more (table 21). New York City, with its preponderance of rental units, clearly had the highest proportion of units (56 percent) in structures with four floors or more; roughly half of these units were in structures with elevators and half were in walkup structures. Several additional cities in the East had more than a fourth of their housing units in structures with four floors or more, many of which were "walkup" structures.

Rooms and bedrooms.—Measured by number of rooms, housing units on the whole were larger than they were in 1950 or in 1940. The median for all units in the United States in 1960 was 4.9 rooms. This compares with a median of 4.6 in 1950 and 4.7 in 1940. The increase from 1950 to 1960 is attributable to the upward trend in the proportion of units with 5, 6, and 7 rooms; each of these categories in 1960 represented a larger percentage of the total housing inventory than in 1950 or 1940, as indicated in figure

FIGURE 16.—NUMBER OF ROOMS IN THE UNIT, FOR THE UNITED STATES: 1940 TO 1960

16. Each of the remaining categories except the 2-room group represented the same or a smaller proportion of the inventory in 1960, although the number of units in each category increased; for the 2-room group, there was a decrease in both the number and percentage since 1950 (table M).

Units with 5 rooms constituted the largest single group in 1960 and units with 4 rooms constituted the next largest group. Together they amounted to almost half (46 percent) of the total housing units. Only 3 percent were 1-room units, and 7 percent were units with 8 rooms or more (table M). On the whole, owner-occupied units were much larger than renter-occupied units, as indicated by the median of 5.5 rooms for owner-occupied units and 3.9 rooms for renter-occupied units.

Housing units were about the same size inside SMSA's as outside SMSA's—the medians being 4.8 and 4.9 rooms, respectively. Within SMSA's, however, they were somewhat smaller in central cities than outside central cities—the medians being 4.6 and 5.1 rooms, respectively (table 10).

Housing units were larger in the Northeast and North Central Regions than in the South and West. The medians were 5.1 and 5.0 rooms in the Northeast and North Central Regions and 4.7 and 4.6 rooms in the South and West, respectively (table 1). In all four regions, the medians were higher than in 1950. By States, the medians in 1960 were largest in Vermont with 5.7 rooms, Delaware and Pennsylvania each with 5.6 rooms, and Maryland with 5.5 rooms. The smallest were in Alaska with 3.5 and Nevada with 4.1 rooms. The District of Columbia, viewed for some purposes as a State, had a median of 3.9 rooms.

Number of bedrooms in the unit was a new item for the 1960 Census. Results show that most units (67 percent) had either two or three bedrooms and 11 percent had four or more (table N). On the other hand, 17 percent had only one bedroom, and 4 percent had none. Other census data⁹ indicate that the latter consisted largely of 1-room apartments, which were considered as having no bedroom. As with rooms, the distribution of units by number of bedrooms differed significantly by tenure. About 57 percent of the owner-occupied units had three bedrooms or more in contrast to 22 percent of the renter-occupied units; and only 7 percent of the owner-occupied units had one or no bedroom in contrast to 40 percent of the renter-occupied units (table 10).

HOUSING QUALITY

Condition and plumbing facilities.—The combination of data on condition and plumbing facilities is considered one measure of housing quality. It takes account of the physical characteristics of the unit—the structural condition and the presence of basic plumbing facilities (water supply, toilet facilities, and bathing facilities). Although such factors as light, ventilation, and neighborhood also reflect quality, particularly in urban areas, it is not feasible to measure them in a large scale census enumeration. These elements, however, often are closely associated with condition and plumbing facilities.

Data on the two subjects in combination provide a more comprehensive measure of housing quality than data on plumbing facilities alone. In rural areas, because a comparatively large proportion of housing units lack plumbing facilities, it is not practical to use plumbing as a sole indicator of housing quality. In urban areas, although plumbing facilities are an important element in the determination of housing quality, the mere presence of facilities does not preclude the possibility of serious housing deficiencies in other respects.

In 1960, a three-way classification (sound, deteriorating, dilapidated) was used to measure condition, compared with a two-way classification (not dilapidated, dilapidated) in 1950. Although the 1950 concept of "dilapidated" was retained for 1960, it is possible that the change from the two-way to the three-way classification introduced an element of difference in the statistics. Furthermore, even with detailed instructions and visual aids in training the enumerators in both 1960 and 1950, it was not possible to achieve uniform results; thus, the data for some areas may have a wider margin of relative error than for others.

Measured by condition and plumbing facilities, the quality of housing improved since 1950. Approximately 43.1 million units (74 percent of all housing units) in 1960 were reported in sound condition and as having all plumbing facilities—piped hot water and private flush toilet and bathtub (or shower) inside the structure (table O). An additional 4.6 million units (8 percent) had all plumbing facilities but they were in deteriorating condition, that is, they were not dilapidated but needed more repair than would be provided in the course of regular maintenance. Thus, the combined group of housing units which were in sound or deteriorating condition and had all plumbing facilities amounted to 47.7 million units, or 82 percent of the housing inventory. Compared with the 29.1 million units (63 percent) in 1950 that were "not dilapidated, with private toilet and bath, and hot running water," this represents an increase of 18.6 million units. In part, the improvement was due to the large amount of new construction during the 1950's. Also, through plumbing improvements and structural repairs, some of the existing units shifted from "lacking plumbing facilities" to having "all facilities" and from "dilapidated" to "sound or deteriorating." (See Volume IV of the 1960 Housing reports, Part 1A, for data on the changes in condition and plumbing between 1950 and 1959 on a unit-by-unit basis.)

TABLE O.—WATER SUPPLY AND CONDITION AND PLUMBING FACILITIES: 1960 AND 1950

[Data for 1960 based on sample; data for 1950 based on complete count]

Dilapidated.....	5.0	3.2	7.8	9.8

In the remaining categories tabulated for condition and plumbing facilities, there were decreases since 1950 in both the numbers and percentages. Units which were dilapidated or lacked one or more plumbing facilities amounted to 10.6 million (18 percent of the total inventory) in 1960 as compared with 17.0 million (37 percent of the inventory) in 1950. The decrease in the number of units dilapidated or lacking plumbing facilities was due partly to the removal of a large number of such units from the inventory through slum clearance, urban renewal, highway construction, and the like, and partly to the upgrading of existing units through the installation of plumbing facilities and renovation of the physical structure.

Housing units that were dilapidated or lacked plumbing facilities were distributed somewhat unevenly by regions. The South, with about three-tenths of all the housing units in the United States, had close to half (5.0 million) of all the units that were dilapidated or lacked plumbing facilities; the North Central Region, also with about three-tenths of all the housing units in the United States, had about three-tenths (3.0 million) of the total units that were dilapidated or lacked plumbing facilities (table 3).

In figure 17, five levels of quality are compared by residence and tenure of the unit and by color of household head. As shown by the chart, the proportion of units reported in sound condition and as having all plumbing facilities in 1960 was higher for units inside SMSA's than for units outside SMSA's, higher for owner-occupied units than for renter-occupied units, and higher for units with white household heads than for units with nonwhite household heads. With respect to dilapidated units, the comparisons are reversed—the percentage dilapidated was lower inside than outside SMSA's, lower for owner-occupied than for renter-occupied units, and lower for units with white than with nonwhite household heads.

By States, the proportions of units in either sound or deteriorating condition and having all plumbing facilities ranged from about 51 percent in Mississippi to 93 percent in California (figure 18). In every State, both the number and percentage of units in this category increased since 1950. At the same time, the number of units that were dilapidated or lacked plumbing facilities de-

⁹ Table 5 in Volume II of the 1960 Housing reports.

FIGURE 17.—CONDITION AND PLUMBING FACILITIES OF HOUSING UNITS, BY TENURE AND COLOR, AND BY INSIDE AND OUTSIDE STANDARD METROPOLITAN STATISTICAL AREAS, FOR THE UNITED STATES: 1960

FIGURE 18.—HOUSING UNITS IN SOUND OR DETERIORATING CONDITION AND WITH ALL PLUMBING FACILITIES, FOR STATES: 1960 AND 1950

hot water by 1960. The remaining 7 percent of the 1960 units (4.1 million) had no piped water inside the structure. A small proportion of these units had piped water outside the structure; but, for the most part, they consisted of units for which the only source of water was a hand pump, open well, spring, or the like. In 1950, units with no piped water inside the structure amounted to 17 percent of the total inventory. In both 1950 and 1960, no piped water inside the structure was primarily a rural characteristic.

Improvements were indicated also by the data on toilet and bathing facilities. The proportion of units with a flush toilet inside the structure for the exclusive use of the occupants increased from 60 percent in 1940 to 71 percent in 1950, then to 87 percent in 1960 (table P). Similarly, the proportion of units with a private bathtub (or shower) increased from 56 percent in 1940 to 69 percent in 1950, then to 85 percent in 1960. Corresponding decreases occurred both in the proportion of units with no flush toilet or bathtub (or shower) and in the proportion of units with shared facilities. By 1960, the proportion with no flush toilet was 10 percent (6.0 million units) and the proportion with no bathtub (or shower) was 12 percent (6.9 million units). Sharing facilities was relatively uncommon in all three census years; in 1960, the proportion was 3 percent for toilet facilities and 3 percent for bathing facilities. Units with shared facilities were found largely in urban areas; on the other hand, units with no flush toilet or bathtub (or shower) were found primarily in rural areas.

Regional patterns for the separate plumbing facilities are similar to those for plumbing combined with condition. The proportions

creased between 1950 and 1960 in every State except Alaska; the decreases ranged from about one-fifth in some States to a little more than one-half in others (table R). Alaska, which more than doubled its housing inventory since 1950, had an increase in the number of units that were dilapidated or lacked plumbing facilities (although this group represented a smaller proportion of the total inventory in 1960).

Water supply, toilet and bathing facilities.—Piped hot and cold water has become a common facility in the American home. In 1960, about 87 percent of the housing units had hot and cold piped water; in 1950, the proportion was 70 percent (table O). Piped water inside the structure, but cold only, was the type of water supply for about 6 percent of the housing units in 1960, as compared with 13 percent in 1950. Presumably, some of the units in the "cold water" group in 1950 had acquired facilities for piped

TABLE P.—TOILET AND BATHING FACILITIES: 1940 TO 1960

No bathtub or shower.....	11.9	4.1	24.8	26.8	39.1

¹ Exclusion of Alaska and Hawaii amounts to approximately 113,000 units (see table A, footnote 2).

of units with piped hot water, private flush toilet, and private bathtub (or shower) were well above the national averages in the West and in the Northeast, about the same as the national averages in the North Central Region, and below the national averages in the South. In all regions except the South, there were more units with piped hot water than with private toilet or bathing facilities; in the South, there were more units with private flush toilet than with piped hot water (table 3).

Bathrooms.—Approximately 5 out of 6 housing units (48.5 million) in 1960 had one or more bathrooms (table Q). Among owner-occupied units, about 89 percent had one or more bathrooms; whereas among renter-occupied units, the proportion was 79 percent. Between urban and rural housing, there was an even greater difference—91 percent of all urban units, in contrast to 65 percent of all rural units, having one or more bathrooms (table 10).

Of the 48.5 million units with one or more bathrooms in the United States, approximately 3.9 million had one bathroom plus a partial bathroom and 4.8 million had two bathrooms or more. Most of the units with more than one bathroom (almost seven-eighths) were owner occupied.

The item on bathrooms is a new one for the 1960 Census of Housing. By definition, a unit is considered to have a bathroom if it has piped hot water, private flush toilet, and private bathtub (or shower); a unit has a bathroom plus a partial bathroom if it has an additional private flush toilet or an additional private bathtub (or shower).

TABLE Q.—NUMBER OF BATHROOMS: 1960

¹ For source of 1950 data, see section on "Description of tables."

² See section on "Housing data for Alaska and Hawaii."

EQUIPMENT AND FUELS

Heating equipment.—About one-third of all housing units in the United States, or 18.4 million, were heated principally by warm-air furnaces (table S). In one-tenth of the units, or 6.5 million, the principal equipment was a floor, wall, or pipeless furnace. The combined group of approximately 24.9 million units heated principally by furnaces of these types amounted to about 43 percent of the housing units. It was this group that increased most since 1950 (after making allowances for vacant units, which were not included in the 1950 statistics on heating equipment).

Steam or hot water and "other means with flue" were each used in over one-fifth of the total units—12.7 million and 13.2 million units, respectively. Steam or hot water was used largely in urban areas, whereas "other means with flue" was more common in rural areas (table W).

"Other means without flue" was the principal equipment in 5.8 million units, or one-tenth of the total. This category consists of

radiant gas heaters without flues, portable heaters (electric, kerosene, or gas), electric or gas steam radiators, and other devices not connected to flues.

In general, the type of heating equipment used in an area depended on the climate. Steam or hot water was more prevalent in northern States, whereas "other means without flue" was concentrated largely in southern States (table 5). Steam or hot water equipment was prevalent also where there were large numbers of multiunit structures.

Air conditioning, washer, dryer, freezer.—Air conditioning was one of several household equipment items for which information was collected for the first time in a housing census in 1960. Although regarded as a luxury item not many years ago, air conditioning was reported in 1960 for approximately 6.5 million occupied housing units (1 in 8). The great majority of these units had one or more room units rather than a central air-conditioning system (table S). By definition, air conditioning is restricted to installations which cool the air by refrigerating apparatus as distinguished from evaporative coolers, fans, and blowers.

Inside SMSA's, the proportion of units with air conditioning was 14 percent and outside SMSA's, 10 percent. For regions, the proportions with air conditioning were 18 percent in the South, 9 percent in the West, 10 percent in the Northeast, and 11 percent in the North Central Region. By States, the range was substantial—from less than 2 percent in Maine, Alaska, and Hawaii to 30 percent in Kansas, Oklahoma, and Texas (table 7).

Clothes washing machines, clothes dryers, and home food freezers also were included for the first time in a census of housing. Equipment not owned by members of the household, such as a washer or dryer provided by the management of an apartment building, was not to be reported.

TABLE S.—SELECTED HOUSEHOLD EQUIPMENT: 1960

¹ Data on heating equipment of occupied units available from the 1950 and 1940 Censuses of Housing.

Approximately 39.1 million households (3 out of 4) had a clothes washing machine. The percentage was lower in urban areas than in rural areas, attributable partly to the greater availability of commercial and self-service laundries and laundry rooms equipped with washing machines in apartment buildings. Nationally, automatic and semiautomatic machines (including washer-dryer combinations) outnumbered the wringer or spinner type by more than 4 million. Washer-dryer combinations, relatively new and more expensive than the washing machines without the drying feature, were reported by only a small proportion of the households—about 2 percent.

Modern home clothes dryers, in which heated air dries the laundry in a rotating drum, are a fairly recent product. Even so, clothes dryers were reported in 9.1 million occupied units (roughly 1 in 6). The proportions were practically the same inside and outside SMSA's and in urban and rural areas (tables S and W). For the Nation as a whole, there were more than twice as many units with electrically heated dryers as with gas heated dryers. There were fairly large differences by States, however. In several States, practically all the dryers were heated by electricity; in two States, the proportion was less than one-half.

Home food freezers also are among the relatively new home equipment items. Nevertheless, there were about 9.8 million occupied units (18 percent) with home food freezers. The proportion was much higher in rural than in urban areas, particularly for farm units; over half the rural-farm units had home food freezers in 1960. For the count of home food freezers, only appliances which were separate from the refrigerator were to be reported.

Telephone, automobiles available.—In 1960, information on telephones and automobiles was collected for the first time in a census of housing. Results indicate that approximately 41.6 million households (4 out of 5) had a telephone in the sense that a telephone was available in the unit or elsewhere for receiving incoming calls. The statistics do not indicate the number of subscribers or the number of telephones installed in homes. The proportion of households with telephone was somewhat higher inside SMSA's than outside SMSA's (table S), and was higher in urban areas than in rural areas (table W).

Statistics on the number of automobiles available pertain to the number of housing units with passenger automobiles owned or regularly used by the occupants and ordinarily kept at home. The statistics do not indicate the number of households that own an automobile or the number of automobiles that are privately owned. Approximately 30.2 million households had one automobile and 11.4 million had two or more, making a total of 41.6 million households (4 out of 5) with at least one automobile. The proportion inside SMSA's (78 percent) was about the same as the proportion outside SMSA's (81 percent). In urban areas, the proportion was lower than in rural areas—76 percent and 85 percent, respectively. In the central cities of SMSA's, the proportion was still lower—67 percent—despite the higher level of money income.

The Northeast had the lowest percentage of households with one or more automobiles (72 percent) and the West had the highest (85 percent). The North Central Region, however, had the largest number of households with one or more automobiles (table 7).

Radio and television.—About 46.3 million households, or 87 percent of the occupied units in the United States, had one or more television sets in 1960 and about 48.5 million households, or 92 percent, had one or more radios (table T). For television sets, this represents a sharp increase from the 12 percent in 1950. With respect to radio sets, the number of households with one or more sets increased since 1950 although the proportion dropped from 96 percent to 92 percent. About one-eighth of the households having television in 1960 had two or more sets, and about three-eighths of those having radio had two or more sets (table 7).

TABLE T.—RADIO SETS, 1930 TO 1960, AND TELEVISION SETS, 1960 AND 1950

[Data for 1960 and 1950 based on samples; data for earlier years based on complete count]

Census year	Total occupied units	Units with—			
		Radio		Television	
		Number	Percent	Number	Percent
United States, 1960.....	53,022,057	48,504,429	91.5	46,312,320	87.3
Inside SMSA's.....	33,998,395	31,494,714	92.6	30,779,300	90.5
Outside SMSA's.....	19,023,662	17,009,715	89.4	15,533,020	81.7
Conterminous United States:					
1960.....	53,811,795	48,311,513	91.5	46,157,950	87.4
1950.....	42,826,281	40,977,847	95.7	5,125,604	12.0
1940.....	34,854,532	28,846,059	82.8	-----	-----
1930.....	29,904,663	12,048,762	40.3	-----	-----

For both radio and television sets, those in working order and those being repaired were to be included in the count; automobile radios, crystal sets, and sending-receiving sets were to be excluded from the count of radios.

Both radio and television sets were more prevalent inside SMSA's than outside SMSA's (table T) and more common in urban areas than in rural areas (table W). Of the four regions, the South had the lowest percentage of units with radio and television sets.

Cooking, heating, and water heating fuels.—Utility gas was the leading fuel used for cooking in 1960, as it was in 1950 and in 1940 (table U). For one-half the occupied units in 1960, utility gas was the principal fuel used for cooking. Although the number of users increased during the decade, the proportion in 1960 was the same as in 1950 and a little higher than in 1940. In urban areas, the proportion of households using utility gas was approximately two-thirds, or 65 percent; in rural areas, however, the proportion was only 14 percent (table W).

Electricity as the principal cooking fuel had by far the largest increase over the past two decades—from 5 percent of all occupied

units in 1940 to 15 percent in 1950 and to 31 percent in 1960. Although electricity was second in importance for the United States as a whole, it was first in importance in rural areas. Bottled, tank, or LP (liquefied petroleum) gas, which was used in 12 percent of all occupied units in the United States, was third among the cooking fuels; for rural housing, it was second only to electricity as the principal fuel used for cooking.

The other cooking fuels had become relatively unimportant. Wood, which was the principal fuel for 24 percent of the occupied units in the United States in 1940, dropped to about 10 percent in 1950 and to 3 percent in 1960. Users of wood for cooking were found largely in rural areas. Coal and the liquid fuel group (including kerosene), each important in the past, had few users in 1960 even in rural areas.

For house heating, there was a shift from solid fuels to gas and oil. The shift was even greater in the decade 1950 to 1960 than in the preceding decade. Utility gas became the most commonly used fuel, having increased from 27 percent of the occupied units in 1950 to 43 percent in 1960. The liquid fuels, of which the principal ones are fuel oils, moved from third in importance in 1950 to second in 1960; they were reported for about 32 percent of the occupied units in 1960. There was a substantial decrease in the number and proportion of households using solid fuels for heating. Coal (or coke) was the leading heating fuel in 1940 and again in 1950, but dropped to third place by 1960. It was the principal fuel for 55 percent of all occupied units in 1940, 35 percent in 1950, and only 12 percent in 1960. Wood followed the same trend—23 percent in 1940, about 10 percent in 1950 and only 4 percent in 1960. Users of wood for heating were found primarily in rural areas.

In rural areas, fuel oil was used more than any other fuel for heating; coal and utility gas were the next most commonly used heating fuels. In urban areas, utility gas had by far the most users. Fuel oil had the next highest number, followed by coal.

In 1960, information on fuel used for heating water was collected for the first time in a census of housing. The principal fuel used for piped hot water was to be reported; units with no piped hot water constitute the "none" category. For the Nation as a whole, utility gas was used most. In about one-half the occupied units

Table U.—COOKING AND HEATING FUELS, 1940 TO 1960, AND WATER HEATING FUEL, 1960

1 Subject not included in the 1950 and 1940 Censuses.

(48 percent), water was heated by utility gas. Electricity was used for about 20 percent of the occupied units, followed by fuel oil for 12 percent of the units. Other fuels were used to a lesser extent. Most of the units in which water was heated by bottled, tank, or LP gas were found in rural areas; most of the units in which water was heated by fuel oil or coal were found in urban areas (table 13). The latter suggests that these fuels were probably used in furnaces and boilers with water heating coils or heat exchangers, or in boilers used only for heating water in apartment buildings.

The proportion of households using a particular fuel for cooking, house heating, and water heating varied considerably by States. There were apparent patterns in the types of fuel used, however. In approximately two-fifths of the States, utility gas was the fuel used most for all three purposes; in another one-fifth, electricity was the leading fuel for cooking and for water heating, and fuel oil was the leading fuel for house heating.

FINANCIAL CHARACTERISTICS

Changes in the price of housing over the past few decades are indicated by the data on value and rent. Medians for the years 1930 to 1960 are shown in table V and full distributions for 1960 are provided in the detailed tables; the figures are expressed in current dollars (the dollar value at the time of the respective censuses). The data indicate the value and rent levels for the various years and do not reflect changes for identical units. To the extent that there have been additions and losses, and shifts in tenure and farm-nonfarm classification among existing units, the value and rent data for the four census years apply to different groups of units. (For changes in value and rent of "same" units, 1950 to 1959, see Volume IV of the 1960 Housing reports, Part 1B.)

Value.—The median value of owner-occupied nonfarm homes in the United States in 1960 was \$11,900. This is more than 1½ times the median of \$7,400 in 1950 and approximately 4 times the median of \$3,000 in 1940. The median of \$3,000 in 1940, compared with the median of \$4,800 in 1930, reflects the deflated values following the depression of the 1930's.

Value is the owner's estimate of how much the property would sell for on the current market. For the most part, the data are restricted to nonfarm units in 1-unit properties without business. (For description of units covered by the data, see definition of "value.")

TABLE V.—MEDIAN VALUE AND MEDIAN MONTHLY RENT OF NONFARM UNITS: 1930 TO 1960

[Data for 1960 based on sample; data for earlier years based on complete count]

Census year	Median value of owner-occupied nonfarm units	Renter-occupied nonfarm units	
		Median contract rent	Median gross rent
United States, 1960.....	\$11,900	\$58	\$71
Inside SMSA's.....	13,500	63	75
In central cities.....	12,300	62	72
Not in central cities.....	14,400	67	81
Outside SMSA's.....	8,600	42	58
Conterminous United States:			
1960.....	11,900	58	70
1950.....	7,400	36	42
1940.....	3,000	21	27
1930.....	4,800	27	-----

NOTE.—1960 and 1950 data on value are for 1-unit structures without business and with only 1 unit in property (see definition of value for other exclusions); 1940 data are for 1-family structures without business; and 1930 data are for both 1-family and multifamily homes. Furthermore, the definition of nonfarm units is not comparable for all years. Although the types of units for which value and rent data were reported are not the same for the four censuses, the differences are not great enough to invalidate comparison of the medians.

Values inside SMSA's in 1960 were significantly higher than those outside SMSA's, as indicated by the respective medians of \$13,500 and \$8,600. The median value of owner-occupied homes in the portion of SMSA's outside central cities was \$14,400—roughly \$2,000 more than the \$12,300 median for homes in the central cities.

Close to one-half the owner-occupied nonfarm units in the United States in 1960 were valued at between \$10,000 and \$20,000 (table 8). Almost two-fifths were valued at less than \$10,000 and the remainder at \$20,000 or more. By regions, the largest proportions of homes valued at \$20,000 or more were found in the West and in the Northeast, each having about one-fifth in this category. The median value was \$13,700 in the West and \$13,300 in the Northeast. On the other hand, the South had the highest proportion (a little more than one-fifth) valued under \$5,000. The median for the South was \$9,500; the median for the North Central Region was \$12,100.

Median values for individual States are shown in figure 19. In 1960, the medians ranged from \$6,700 in Arkansas to \$20,900 in Hawaii. Connecticut was second highest with a median of \$16,700. Other States for which the median value exceeded \$15,000 were New Jersey, New York, Nevada, and California. The District of Columbia, viewed for some purposes as a State, also had a relatively high median. At the low end of the value scale with median values of \$8,000 or less were North Carolina, Oklahoma, Mississippi, West Virginia, South Carolina, and Arkansas.

FIGURE 19.—MEDIAN VALUE OF OWNER-OCCUPIED NONFARM UNITS, FOR STATES: 1960 AND 1950

[Restricted to 1-unit properties without business]

All States had increases in median values from 1950 to 1960. Except for the District of Columbia, which had a relatively small increase, the increases ranged from about 26 percent in Rhode Island to 110 percent in Louisiana and 160 percent in Alaska. In two-thirds of the States, the increases were between 50 and 80 percent.

Contract rent, gross rent.—Rents tended to follow the same general trend as home values since 1930. The median monthly contract rent of renter-occupied nonfarm units in the United States decreased from \$27 in 1930 to \$21 in 1940, then increased substantially to \$36 in 1950 and to \$58 by 1960 (table V). The 1960 median is roughly 1.6 times the 1950 median and 2.8 times the 1940 median. Changes reflected by the census data are not comparable with changes in rents obtained by the Bureau of Labor Statistics for its Consumer Price Index. The latter reflects changes in rent for essentially similar units with comparable services and facilities.

Changes in median gross rents were relatively of the same magnitude as for contract rent. The median gross rent for the United States was \$71 in 1960, which was approximately 1.7 times the \$42 median in 1950 and 2.6 times the \$27 median in 1940. Gross rent is the contract rent plus the monthly average of any additional costs that are paid by the renter for utilities and fuel; whereas contract rent is the monthly rent agreed upon regardless of any utilities, services, or furnishings that are included. Gross rent, therefore, eliminates differentials which result from varying practices with respect to the inclusion of utilities and fuel as part of the rental payment. Data on gross rent, as for contract rent, exclude rents for farm units.

FIGURE 20.—MEDIAN GROSS RENT OF RENTER-OCCUPIED NONFARM UNITS, FOR STATES: 1960 AND 1950

For renter-occupied units inside SMSA's, the median gross rent was \$75. In the central cities of SMSA's, the median was \$72 as compared with \$81 in the portion of SMSA's outside central cities. The rents inside SMSA's were higher than outside SMSA's, where the median was \$58.

Approximately 1.4 million nonfarm renter-occupied units were occupied on a "no cash rent" basis. Among these were units provided by relatives not living in the unit and occupied without rental payment and units provided in exchange for services rendered. Nearly half the no-cash-rent units were in the South (table 8).

Of the units reporting cash rent, gross rents for close to one-fifth of the units in the United States were \$100 or more, and gross rents for one-third of the units ranged from \$70 to \$99. These proportions applied also to the Northeast, the West, and the North Central Regions. In the South, however, the proportions in the respective two groups were lower; about one-tenth of the units had gross rents of \$100 or more and one-fourth had gross rents between \$70 and \$99. The medians, which are based on the number reporting cash rent, were \$59 for the South and \$76, \$75, and \$72 for the West, North Central, and Northeast Regions, respectively.

For States, median monthly gross rents in 1960 ranged from \$43 in Mississippi to \$126 in Alaska (figure 20). Second highest was Nevada with \$91, followed by Illinois with \$85 and New Jersey with \$80. The District of Columbia also had a relatively high median—\$81. Median gross rents amounted to less than \$50 in South Carolina, Arkansas, Alabama, and Mississippi.

Gross rent levels of all States were higher in 1960 than in 1950. On the basis of the medians, increases ranged from 48 percent in Idaho to 96 percent in Louisiana. The increase for the District of Columbia was about 42 percent.

SELECTED SUMMARY CHARACTERISTICS

Urban and rural units.—In 1960, rural housing constituted 30 percent of the total housing inventory, with about one-fifth of the rural units on farms. The four-fifths of rural housing units identified as nonfarm include homes in the open country, as well as those in rural villages and in the rural territory outside urbanized areas. Urban housing, which constituted 70 percent of all housing in 1960, comprises units in all places of 2,500 inhabitants or more and in the urban fringes of urbanized areas.

A comparison of rural and urban housing characteristics shows homeownership more common in rural areas, with 71 percent owner occupancy in contrast to 58 percent in urban areas (table W). Rural housing units, particularly those on farms, were larger than urban units; but rural units had more persons in the household. Almost one-seventh of the rural units, compared with one-tenth of the urban units, had 1.01 or more persons per room.

Measured by condition and plumbing facilities, rural housing was below urban housing in quality. Approximately one-third of the rural units, in contrast to one-tenth of the urban units, were dilapidated or lacked one or more plumbing facilities.

The proportion of new units (built in the 1950's) and the proportion of old units (more than 30 years old) were roughly the same in rural and urban areas. On farms, however, there were relatively fewer new units and more old ones.

The median value of owner-occupied urban homes was about 1½ times the median for rural-nonfarm homes. The median monthly gross rent of renter-occupied urban units was about 1½ times that of rural-nonfarm units.

Nearly one-fourth (23 percent) of the households living in urban areas in 1960 had moved into their homes during the preceding 1½ years (January 1959 through March 1960); the proportion for rural households was a little lower (20 percent). Only one-tenth of the farm households had moved into their homes in the 1½-year period.

¹ See table C, footnote 1.² 1950 data for radio, television, heating fuel, cooking fuel, value and rent restricted to continuous United States; thus the data exclude characteristics for approximately 89,000 occupied urban units and 53,000 occupied rural units in Alaska and Hawaii.³ Data available for occupied units only.⁴ Subject not included in the 1950 Census.⁵ Restricted to 1-unit properties without business (see definition of value for other exclusions).

Air conditioning, telephone, radio, and television were more prevalent in urban than in rural areas; automobiles, clothes washing machines, and home food freezers were more common in rural areas, particularly among farm households. Clothes dryers were found in about the same proportion in urban as in rural units.

Warm-air furnaces were the most common heating equipment in urban homes, with steam or hot water systems ranking second. "Other means with flue," such as stoves and radiant gas heaters connected to a chimney or flue, were the most common in rural homes, with warm-air furnaces ranking next. Utility gas was the principal fuel for heating and also for cooking in urban areas; fuel oil for heating and electricity for cooking were the principal fuels in rural areas.

Compared with 1950, changes were substantial for some characteristics and minor for others. For example, the proportion of rural units with piped water inside the structure increased from 58 percent in 1950 to 79 percent in 1960; for urban units, the increase was from 96 percent to 99 percent. These and other comparisons are shown in table W.

Units with nonwhite household heads.—Approximately one-tenth of the occupied housing units in 1960 had nonwhite household heads. Two-thirds of the nonwhite households were inside

¹ Restricted to 1-unit properties without business (see definition of value for other exclusions).

SMSA's, predominantly in the central cities. Over half the total nonwhite households in the United States were in the South (table 23).

Compared with all occupied units, those occupied by nonwhites had fewer rooms but larger households (tables X, M, and J). The median number of rooms for units occupied by nonwhites was 4.2 and the median number of persons in the household was 3.2; for all occupied units (white and nonwhite), the medians were 4.9 rooms and 3.0 persons. About 28 percent of the units occupied by nonwhites had 1.01 or more persons per room, compared with 12 percent for all occupied units. Among nonwhites inside SMSA's, owner-occupied units had more rooms and larger households than renter-occupied units; outside SMSA's, owner-occupied units had more rooms but smaller households than renter-occupied units.

Over half the units (56 percent) occupied by nonwhites were "sound or deteriorating, with all plumbing facilities," compared with 82 percent of all housing in this category. In 1950, only 27 percent of the housing occupied by nonwhites were in this top category, compared with 63 percent for all housing (table O). The highest proportion of the better quality housing occupied by nonwhites in 1960 was in the central cities of SMSA's (75 percent), and the lowest (23 percent) was outside SMSA's.

The proportion of nonwhite households in 1960 that had moved into their present units during the preceding 1½ years (January 1959 through March 1960) was 23 percent. The proportion for all households was about the same—22 percent (table K).

Only 38 percent of the nonwhite households owned their homes, compared with 62 percent of all households. The relative increase from 1950 to 1960, however, was higher for nonwhite than for white households (table G).

The median value of nonfarm properties occupied by nonwhite owners was \$6,700, and the median monthly gross rent of nonfarm units occupied by nonwhite renters was \$58. The medians were somewhat higher inside SMSA's than outside SMSA's. On the whole, the medians for units occupied by nonwhites were considerably lower than the medians for all units (table V).

The proportions of nonwhite households having the household equipment items included in the census were lower than the averages for all households (tables S and T). For example, only 2 percent of the nonwhite households had a clothes dryer, compared with 17 percent for all households. Similarly, 49 percent of the nonwhite households had at least one automobile, whereas the percentage for all households was 78.

Available vacant units.—In 1960, there were slightly more than ½ million housing units vacant and available for sale and almost 1½ million vacant and available for rent. These were vacant units in sound or deteriorating condition and intended for year-round occupancy. On the average, vacant units for sale were larger than vacant units for rent (a median of 5.3 rooms compared with 3.5 rooms) and a larger percentage had all plumbing facilities (89 percent compared with 74 percent). Almost a third of the for-sale units and a fourth of the for-rent units had been vacant for 6 months or longer (table Y).

Compared with the inventory of owner-occupied units, vacant units available for sale were smaller; the median for vacant units available for sale was 5.3 rooms and the median for owner-occupied units was 5.5 rooms (table M). About the same proportion of the sound and deteriorating units had all plumbing facilities—89 percent for available vacant units for sale and 91 percent for owner-occupied units (table 3). The price asked for vacant units was

substantially higher than the value of owner-occupied units, with a median of \$13,500 for vacant units and \$11,900 for owner-occupied units (table V). The higher proportion of new units among the for-sale vacancies accounts partly for the higher median. According to data in Volume II of the 1960 Housing reports, approximately three-fifths of the for-sale vacancies were new (built in the 1950's); about one-third of the owner-occupied units were new. Furthermore, the median for vacant units represents the asking price at the time of enumeration and may differ substantially from the final sale price.

Compared with the inventory of renter-occupied units, vacant units available for rent were smaller; the median for vacant units available for rent was 3.5 rooms and the median for renter-occupied units was 3.9 rooms (table M). About 74 percent of the vacant units for rent had all plumbing facilities, whereas 82 percent of the renter-occupied units that were in sound or deteriorating condition had all plumbing facilities (table 3). The median rent asked for vacant units available for rent, \$57, was approximately the same as the median contract rent for renter-occupied units, which was \$58 (table V). According to data in Volume II of the 1960 Housing reports, units built in the 1950's accounted for about one-fifth of the vacancies available for rent and about one-sixth of the renter-occupied inventory.

TABLE Y.—SELECTED CHARACTERISTICS OF AVAILABLE VACANT UNITS: 1960

[Data on plumbing facilities and number of rooms based on complete count; remaining data based on sample]

¹ Value data are restricted to 1-unit properties without business. In rural territory, both the rent and value data exclude vacant units on places of 10 or more acres (see definitions of value and rent).

INTRODUCTION

GENERAL

Volume I of the 1960 Housing reports presents basic statistics on all subjects for which information was collected in the Census of Housing, taken as of April 1, 1960. The housing unit is the reporting unit for this volume.

The volume is arranged by chapters and is bound in nine parts. Part 1 consists of the United States Summary chapter; Parts 2 to 8 contain the separate chapters for the States and the District of Columbia; and Part 9 comprises the chapters for Puerto Rico, Guam, and the Virgin Islands of the United States. The statistics for the three outlying areas in Part 9 differ somewhat in detail and scope from those published for the United States.

The statistics relate to occupancy characteristics, structural characteristics, condition and plumbing facilities, equipment and fuels, and financial characteristics. For the most part, Volume I is restricted to simple distributions of these characteristics; cross-tabulations for both occupied and vacant units are provided in other 1960 Housing reports. Although statistics for some of the subjects are based on a complete count of housing units, most of the data are based on samples of 25, 20, or 5 percent of the units. The subjects represent a modification and an expansion of the 1950 and 1940 Censuses of Housing.

The State chapters present statistics for the State, inside and outside standard metropolitan statistical areas, and the urban, rural-nonfarm, and rural-farm parts of the State; for each standard metropolitan statistical area, urbanized area, place, and county; and for the rural-nonfarm and rural-farm parts of each county. The number of characteristics and the amount of detail presented are generally greater for areas with a large population than for areas with a small population. For example, the full distribution by number of rooms and the median are shown by tenure and vacancy status for standard metropolitan statistical areas and their constituent parts, urbanized areas, and each place of 50,000 inhabitants or more. In contrast, only the average number of rooms, by tenure, is shown for places with a population of 1,000 to 2,500.

The United States Summary chapter contains detailed data for the United States as a whole, the four regions, and the nine groups of States designated geographic divisions, as well as summaries of the statistics for the States and the District of Columbia and for standard metropolitan statistical areas and places of 100,000 inhabitants or more (with data on elevator in structure for places of 50,000 inhabitants or more). Detailed data are presented also for the United States by inside standard metropolitan statistical areas (separately for housing units in central cities and not in central cities) and outside standard metropolitan statistical areas, and by urban, rural-nonfarm, and rural-farm residence; for each region and division, summary data are presented by these same area and residence classifications. In addition, there is included in the United States Summary chapter an analysis of the 1960 Census findings and some historical data for purposes of comparison.

Some characteristics are presented for all housing units, whereas other items are restricted to specific segments of the housing inventory. For example, data on condition and plumbing facilities are presented for all housing units; number of persons and persons per room apply to occupied units; seasonal status applies only to vacant units; and value data are shown for owner-occupied units and vacant units available for sale. Other characteristics are available only for areas of specified size; for example, data on elevator in structure are available for places with a population of 50,000 or more, whereas data on source of water and method of sewage disposal are not available for such places.

In some instances, a characteristic is not shown for each of the tenure and vacancy groups so that the separate distributions do not add to the distribution for all units. For example, data on number of bathrooms (in table 4 of the United States Summary chapter and table 3 of the State chapters) are presented for all units (occupied and vacant) and separately for owner-occupied and renter-occupied units; vacant units are included in the distribution of "all" units but are not shown as a separate group. Data on number of rooms in the same tables are presented for all units (occupied and vacant) and separately for owner-occupied, renter-occupied, vacant available-for-sale, and vacant available-for-rent units; vacant units not on the available sale-or-rent market are included in the distribution of "all" units but are not shown as a separate group. (Furthermore, the distributions for vacant units are based on the 100-percent tabulation and the distributions for all, owner-occupied, and renter-occupied units are based on the 25-percent sample; see section on "Sample design.")

Data on characteristics of housing units with nonwhite household heads are presented for specified areas in both the State chapters and in the United States Summary chapter. In addition, in the State chapters only, data on selected characteristics of housing units with white household heads having Spanish surnames are presented for specified areas in five Southwestern States (Arizona, California, Colorado, New Mexico, and Texas); similar data are presented for housing units with household heads of Puerto Rican birth or parentage for specified areas in the other States. (See section on "Description of tables.")

DESCRIPTION OF TABLES

Detailed tables in State chapters.—The tables are arranged, for the most part, by type of area. Maximum detail is shown for the State, standard metropolitan statistical areas (SMSA's), and urbanized areas. Table 1 contains selected summary information for the State by inside SMSA's (separately for housing units in central cities and not in central cities) and outside SMSA's, and by urban, rural-nonfarm, and rural-farm residence; for each SMSA; and for each place of 10,000 inhabitants or more. Tables 2 to 7 present detailed characteristics for the State, inside and outside SMSA's, and the urban, rural-nonfarm, and rural-farm parts of the State (except that table 7 does not contain data for rural-farm units). Tables 8 to 11 are similar in content to tables

1 to 7 but are restricted to housing units with nonwhite household heads. Tables 9 to 11 are omitted for States having fewer than 25,000 units with nonwhite household heads. The subjects contained in each table are specified in the index on pages x and xi in Parts 2 to 8 of Volume I.

Tables 12 to 17 are for SMSA's and their constituent parts (including each city of 50,000 inhabitants or more) and for urbanized areas. Categories for the items in these tables are shown in the same detail as in the tables for the State. Tables 12 to 17 are omitted for States with no SMSA's, urbanized areas, or places of 50,000 inhabitants or more (Alaska, Idaho, Vermont and Wyoming).

Less detail is presented in tables 18 to 27, which are for places under 50,000 inhabitants, by size groups. The amount of information varies by size of place, with minimum data for places of 1,000 to 2,500 inhabitants. Places of 25,000 to 50,000 inhabitants are covered in tables 18 to 21; places of 10,000 to 25,000 in tables 22 to 24; places of 2,500 to 10,000 in tables 25 and 26; and places of 1,000 to 2,500 in table 27.

County data are presented in tables 28 to 35. Tables 28 to 30 are for counties outside SMSA's (counties inside SMSA's are covered in tables 12 to 17). In the New England States, however, tables 28 to 30 are for all counties. Tables 31 and 32 are for rural-nonfarm housing and tables 33 and 34 are for rural-farm housing in all counties. Table 35, which presents data on source of water and sewage disposal, provides county totals excluding units in places which had 50,000 inhabitants or more in 1950 or in an interim census prior to 1960.

Tables 36 to 39 present statistics for housing units with nonwhite household heads for SMSA's and urban places (places of 2,500 inhabitants or more) having a specified number of such units—table 36 for 100 to 400 units, table 37 for 400 to 2,000 units, and tables 38 and 39 for 2,000 or more units. The number of characteristics and the amount of detail vary according to the number of units with nonwhite household heads. Tables 40 to 42 present statistics for housing units with white household heads having Spanish surnames in Arizona, California, Colorado, New Mexico, and Texas, or for housing units with Puerto Rican heads in the remaining States. Table 40 is restricted to SMSA's and urban places having 400 to 2,000 such units and tables 41 and 42 to areas and places having 2,000 or more. Tables are omitted if there are no SMSA's or urban places with the specified number of such units.

Data for most of the characteristics are based on samples of housing units; where the samples are of different sizes, the figures may not add precisely to the same totals. For example, the total for "all units" by condition and plumbing facilities may differ from the total for "all units" by number of bathrooms (see section on "Sample design").

Detailed tables in United States Summary chapter.—The detailed tables in the United States Summary chapter also are arranged by type of area; maximum detail is provided in practically all the tables. Table 1 presents summary characteristics for the United States as a whole and for each region, division, and State. Table 2 contains the same summary characteristics as table 1 but presents them for each region and division by inside SMSA's (separately for in central cities and not in central cities) and outside SMSA's, and by urban, rural-nonfarm, and rural-farm residence. Tables 3 to 8 present data on detailed characteristics for the United States and for each region, division, and State. The same detailed characteristics are presented in tables 9 to 14 for the United States by inside SMSA's (separately for in central cities and not in central cities) and outside SMSA's, and by urban, rural-nonfarm, and rural-farm residence, and in tables 15 to 20 for each SMSA and place of 100,000 inhabitants or more. In terms of the subjects and categories covered, tables 1 to 20 correspond with tables 1 to 7 in the State chapters. The subjects

contained in each table are specified in the index on pages xii and xiii of the United States Summary chapter (Part 1 of Volume I).

Table 21 presents data on elevator in structure for large urban places. Although all places of 50,000 inhabitants or more in 1960 are listed in the table, data on elevator in structure are restricted to those places which had 50,000 inhabitants or more in 1950 or in an interim census prior to 1960. The data in table 21 do not appear in the State chapters.

Tables 22 to 29, covering data for the United States, regions, divisions, and States, are restricted to units with nonwhite household heads. Tables 22 and 23 parallel tables 1 and 2, respectively; tables 24 to 26 and tables 27 to 29 parallel tables 3 to 8 and 9 to 14, respectively. In tables 22 and 23, separate data are shown for areas having 400 or more units with nonwhite household heads, and in tables 24 to 26 separate data are shown for areas having 25,000 or more such units. With respect to the subjects and categories covered, tables 22 to 29 correspond with tables 8 to 11 in the State chapters.

Table 30 is limited to SMSA's and places having 10,000 or more units with nonwhite household heads. The items covered in this table (household equipment and number of bathrooms) are not included in the tables for nonwhite occupied units in individual areas and places in the State chapters.

Data for States and for the large SMSA's and places in the United States Summary chapter (except as noted for table 30) are taken from the tables in the individual State chapters. The tables in the State chapters, however, cover additional information. In the State chapters, data for States are presented by area and residence classifications and data for SMSA's are presented for the constituent parts of the area; for large urban places, the State chapters contain additional data for units with nonwhite household heads.

As in the State chapters, data for most of the items are based on samples of housing units. Distributions based on samples of different sizes may not add precisely to the same totals (see section on "Sample design").

Text tables in United States Summary chapter.—In the Summary of Findings in the United States Summary chapter, data on selected characteristics are presented in text tables A to Y. In addition to the 1960 data, statistics available from the 1950 and earlier censuses are included for purposes of comparison. For many of the characteristics, statistics are presented by inside SMSA's (separately for in central cities and not in central cities) and outside SMSA's. A limited amount of data is presented for the United States by urban, rural-nonfarm, and rural-farm residence, and for regions, divisions, States, and large cities.

Tables A, B, and C present counts of housing units in the inventory by geographic and residence classifications. Table E presents figures on the components of change in the housing inventory between 1950 and 1959 based on results of the December 1959 Components of Inventory Change survey, which is part of the 1960 Census of Housing. Tables D and F present counts of housing units and population. Tables G to K and M to V contain statistics on the various characteristics of housing units—by inside and outside SMSA's in most of the tables. Table L presents the counts of vacant units by condition and status; table W contains data on selected characteristics of urban and rural units (separately for rural-farm units in 1960); table X is restricted to characteristics of units with nonwhite household heads; and table Y is limited to characteristics of available vacant units. It should be noted that all available vacant units (both urban and rural) are included in table Y, except in the data on value and rent. The subjects and the area classifications covered in each table are specified in the index on pages x and xi of the United States Summary chapter (Part 1 of Volume I).

The term "United States" when used without qualification in the tables refers to the 50 States (including Alaska and Hawaii)

and the District of Columbia. For purposes of comparability, statistics in some cases are for conterminous United States, that is, the United States exclusive of Alaska and Hawaii; generally, the two States were excluded if comparable statistics for 1950 and earlier were not available for either or both States (see also section on "Housing data for Alaska and Hawaii"). In tables F and H, data for the early census years include statistics for Arizona, New Mexico, and Oklahoma, although they did not become States until after 1890.

Except for a few characteristics of vacant units, the 1960 figures are based on samples of housing units; where the samples are of different sizes, the figures may not add precisely to the same totals. Figures for 1950 are based on the complete count except for a few items which are based on 20-percent samples. Figures for 1940 and earlier also are based on the complete count. (For size of sample for individual items, see table I.)

To compare with the 1960 characteristics, the "not reported" categories in the 1950 and earlier data were eliminated by distributing the "not reported" cases in the same proportion as those reporting. Thus, the figures in the text tables reflect this adjustment of the published data. For the sample items in 1950, a further adjustment was made in the published 1950 data by ratio estimating the sample figures to the totals based on the complete count; this procedure was applied separately to the distributions for conterminous United States, Alaska, and Hawaii. For table W, the adjustment was made for urban and rural units independently of the total; therefore, the two 1950 figures in a category may not add to the total for the category, shown in other tables. Similarly, in table R the 1950 figures for "dilapidated or lacking plumbing facilities" for the United States and each State were adjusted independently; the sum of the figures for the States, therefore, do not add precisely to the figure for the United States.

Disclosure of data.—To avoid disclosure of information for individual housing units, characteristics are not shown if the base is four or fewer units. The base, for this purpose, is "all" housing units or "occupied" housing units except for value and rent data, for which the base is the number of units of the type for which value and rent were tabulated. For example, a distribution of units by gross rent is not shown if the number of renter-occupied nonfarm units is four or fewer.

Medians, averages (including population per occupied unit), and percentages are not shown where the base is smaller than the required minimum (see section on "Sample design"). Furthermore, percentages are not shown if they are less than the 0.1 minimum.

Leaders (---) in a data column indicate that either there are no cases in the category or the data are suppressed, for the reasons described above. Leaders are also used where data are inapplicable or not available.

A plus (+) or a minus (−) sign after a median indicates that the median is above or below that number. For example, a median of "5,000—" for value of property indicates that the median fell in the interval "less than \$5,000" and was not computed.

MAPS, CHARTS, GRAPHS

Included in the United States Summary part and the State parts of Volume I are maps of the United States showing the regions, geographic divisions, and States, and the location and names of the standard metropolitan statistical areas as defined for the 1960 Census. Included in each State chapter is a map of the State showing the outlines of counties (parishes for Louisiana and election districts for Alaska) and standard metropolitan statistical areas, if any, and the location of places of 10,000 inhabitants or more. A map of each urbanized area, if any, also is included in the appropriate State chapter.

The United States Summary chapter of Volume I also contains a number of maps, charts, and graphs (figures 5 to 20), which pictorialize some of the statistical findings from the 1960 and earlier censuses. In the charts and graphs which show data for 1950 and earlier, statistics for Alaska and Hawaii were included when comparable data were available (see section on "Housing data for Alaska and Hawaii"). The omission of these two States from some of the statistics is considered to have a negligible effect on comparability for the United States as a whole. Figures 5 to 20 are discussed in the Summary of Findings in the United States Summary chapter.

COMPARABILITY WITH 1950 CENSUS OF HOUSING

More subjects were covered in the 1960 Census of Housing than in the 1950 Census of Housing. Items which were added for 1960 are: Year moved into unit, duration of vacancy, presence of basement, elevator in structure, number of bedrooms, number of bathrooms, source of water, method of sewage disposal, clothes washing machine, clothes dryer, home food freezer, telephone available, automobiles available, air conditioning, and water heating fuel. In addition, access to unit and kitchen or cooking equipment were enumerated in 1960 as part of the determination of a housing unit; and number of acres in the place and sales of farm products were enumerated for the purpose of determining farm residence. On the other hand, information was collected in 1950, but not in 1960, on electric lighting, refrigeration equipment, and kitchen sink. Mortgage status, which was included in 1950, is covered in the Residential Finance program in 1960.

The above comparisons relate to subjects covered in the April enumeration of the 1960 and 1950 Censuses of Housing. Subjects enumerated in the Components of Inventory Change and Residential Finance surveys, started in late 1959 and completed in 1960 as part of the 1960 Census of Housing, are discussed in Volumes IV and V, respectively. Subjects enumerated in the 1950 Residential Finance survey also are discussed in Volume V of the 1960 Housing reports.

Some items in 1960 have more detail and a few have slightly less detail than the comparable items in 1950. Additional information was collected in 1960 on condition of housing units, type of heating equipment, description of trailers, description of vacant units not on the market, and number of television and radio sets. Slightly less detail is available in 1960 than in 1950 for type of structure and toilet facilities.

In 1950, information for most of the items was collected on a complete-count basis. For a few items, information was collected from 20-percent samples of units (see section on "Sample design").

The foregoing discussion applies specifically to conterminous United States. For a discussion of 1950 data for Alaska and Hawaii, see the section on "Housing data for Alaska and Hawaii."

Data from the 1950 Census for areas of the type covered in Volume I of the 1960 Housing reports are published in *1950 Census of Housing, Volume I, General Characteristics*. Selected 1950 data are included in Volume I of the 1960 Housing reports in the United States Summary chapter (see also section on "Description of tables").

Changes since 1950 were made in the definitions of some of the major concepts, particularly in the concepts of unit of enumeration and farm housing. They were made in order to improve the usefulness of the data although it was recognized that comparability with previous censuses would be affected.

Procedures for collecting and processing the data in 1960 also differed from 1950. In this respect, the 1960 Census contained several innovations. One of the innovations was the use of forms which household members themselves were asked to complete—the Advance Census Report form used on a nationwide basis for

complete-count items, and the Household Questionnaire used in the more populous areas for sample items. Information for items not completed by the respondents was obtained by enumerators in direct interview. Other innovations included the division of the census period into two stages in the more populous areas, the greater use of sampling, the use of formal field review procedures, and the extensive use of the electronic computer and related equipment to process the data and produce the final tables. These innovations were designed primarily to improve the quality of the statistics and to reduce the time required to collect and publish the data; at the same time, they have introduced an element of difference between the 1960 statistics and those of earlier censuses.

Changes and innovations are discussed in the sections on "Definitions and explanations" and "Collection and processing of data," which appear later in this report.

HOUSING DATA FROM OTHER CENSUSES

Many of the subjects covered in the 1940 Census of Housing are included in the April 1960 Census of Housing. The subjects specified above as having been added since 1950 were also added since 1940. One item, television sets, was enumerated in 1960, but not in 1940. On the other hand, information was collected in 1940, but not in 1960, on exterior material, lighting equipment, refrigeration equipment, estimated rentals of owner-occupied homes, and value and rent of farm dwellings. Information on conversion, which was included in 1940, is covered in the December 1959 Components of Inventory Change program as part of the 1960 Census of Housing.

Although the 1940 Census of Housing was the first complete census of housing, data on a few housing characteristics were collected in earlier years in conjunction with the decennial censuses of population. Statistics on the number of occupied units and population per unit, which are essentially comparable with current data but identified by various terms, are presented in reports on earlier censuses since 1890, with limited data back to 1850. In these reports, statistics are shown in terms of "homes," "families," or "private families." In some censuses, the statistics include quarters of "quasi-families" (quarters identified in the 1960 Census as group quarters). In addition, counts of units by color of household head are available for each census year since 1890, except 1910 when such data were available only for the Southern States. The classification by tenure has been reported since 1890. Mortgage status of owned units was included in the Censuses of Population from 1890 to 1920, and detailed data (including value of mortgaged property) were reported in 1890 for owned units that were encumbered (mortgaged). Value and monthly rent of nonfarm units and the number of units with a radio were included for the first time in the 1930 reports. Statistics on the number of dwellings and persons per dwelling also are available from the Censuses of Population from 1890 to 1930, the concept of "dwelling" being roughly comparable with the current concept of "structure"; in some of the censuses, information on number of families per dwelling was included.

The discussion in the above two paragraphs applies specifically to conterminous United States. For a discussion of 1940 and earlier data for Alaska and Hawaii, see the section on "Housing data for Alaska and Hawaii."

Data from the 1940 Census for areas of the type covered in Volume I of the 1960 Housing reports are published in *1940 Census of Housing, Volume II, General Characteristics*. Selected data for 1940 and earlier are included in Volume I of the 1960 Housing reports in the United States Summary chapter (see also section on "Description of tables").

In some instances, concepts and procedures were not identical from census to census as discussed under the item in the section on "Definitions and explanations." The differences for the most

part, however, are not great enough to invalidate comparisons of the data. Comparisons with earlier censuses are restricted to censuses of housing and population, although information for a few characteristics related to housing was collected in censuses covering other subjects.

HOUSING DATA FOR ALASKA AND HAWAII

In censuses prior to 1960, the subjects and procedures for Alaska and Hawaii as territories differed somewhat from the standard program for States. Some items which were included in the census for States were omitted from the censuses in Alaska and Hawaii, and vice versa; and some items were not tabulated in the same detail as for States. Statements regarding the 1950 and earlier censuses appearing elsewhere in Volume I, apply specifically to conterminous United States; for Alaska and Hawaii, these statements should be modified where differences occurred.

Alaska.—From the 1950 Census, which was the first census of housing in Alaska, data on the following items are available: Tenure and race, vacancy status, persons, and persons per room; number of rooms, year structure built, number of units in structure, and exterior material; condition and plumbing; water supply, toilet facilities, and bathing facilities; heating equipment and heating fuel, electric lighting, kitchen sink, and radio; and value of owner-occupied nonfarm units and contract rent of renter-occupied nonfarm units.

The 1950 definitions were the same as those used for conterminous United States with the following exceptions: For number of units in structure, no distinction was made between detached and other 1-unit structures; for the category "piped running water inside structure," no distinction was made between "hot and cold" piped water and "only cold" piped water; for heating fuel, utility and bottled gas were included in the category "other fuel." For the 1950 data in the Summary of Findings in the United States Summary chapter (Volume I of the 1960 Housing reports), the number of units in 1-unit structures in Alaska was apportioned between "detached" and "other" on the basis of the 1960 ratio of "1-unit detached" to "1-unit attached" structures. Similarly, the number of units with piped water inside structure was apportioned between "hot and cold" and "cold only" on the basis of the 1960 ratio for such units. The effect of these adjustments on the comparability of 1960 and 1950 data for the United States as a whole is considered negligible. The detailed data and description of concepts for 1950 may be found in *1950 Census of Housing, Volume I, General Characteristics*, Part 7.

For 1940 and earlier, data on a few housing characteristics were collected in conjunction with the censuses of population. In the 1940 Census (taken in Alaska in October 1939), only occupied units were enumerated. Data on the following items are available: Number of rooms, tenure, value of owner-occupied units (including farm units), and contract rent of renter-occupied units (including farm units). The population per occupied unit can be computed from the data available. Statistics on the number of occupied units and population per unit, which are essentially comparable with current data, are available from the Censuses of Population from 1930 back to 1900; in these reports, statistics are shown in terms of "homes," "families," or "private families." Counts by tenure, including the number of owned units that were encumbered, are available from the Censuses of Population from 1920 back to 1900. Statistics on the number of dwellings and persons to a dwelling also are available from 1900 to 1930, the concept of "dwelling" being essentially comparable with the current concept of "structure." The concepts are essentially the same as those for conterminous United States. For 1940 and earlier, the data may be found in the reports of the censuses of population for Alaska.

Statistics by urban-rural and farm-nonfarm residence are available for 1950. For earlier censuses, however, housing characteristics have not been tabulated by residence (except for urban and rural figures on tenure and color for 1940).

Hawaii.—From the 1950 Census, data on the following items are available: Tenure and race, vacancy status, persons, and persons per room; number of rooms, year structure built, number of units in structure, and exterior material; condition and plumbing; water supply, toilet facilities, and bathing facilities; electric lighting and refrigeration equipment; and value of owner-occupied units, value of vacant units for sale, mortgage status of owner-occupied units, contract rent of renter-occupied units, and rent asked for vacant units for rent.

The 1950 definitions were the same as those used for conterminous United States with the following exceptions: For number of units in structure, no distinction was made between detached and other 1-unit structures; data on value for owner-occupied units were restricted to units whose occupants owned both the unit and the land; and farm units were included in the data on value and rent. For the 1950 data in the Summary of Findings in the United States Summary chapter (Volume I of the 1960 Housing reports), the number of units in 1-unit structures in Hawaii was apportioned between "detached" and "other" on the basis of the 1960 ratio of "1-unit detached" to "1-unit attached" structures. For the 1950 data on vacancy status, the number of vacant units for seasonal occupancy was estimated from the "not available" group on the basis of the proportion of the 1960 "not available" units which were for seasonal occupancy. The effect of these adjustments on the comparability of 1960 and 1950 data for the United States as a whole is considered negligible. The detailed data and description of concepts for 1950 may be found in *1950 Census of Housing, Volume I, General Characteristics, Part 7*.

For the 1940 Census, which was the first Census of Housing in Hawaii, data are available on the following items: Tenure and race, persons, and persons per room; number of rooms, number of units in structure, and exterior material; condition (state of repair); water supply, toilet facilities, and bathing facilities; lighting equipment, refrigeration equipment, and radio; value and mortgage status of owner-occupied units, contract rent of renter-occupied units, and the estimated rental value of owner-occupied and vacant units. The concepts reflect a few minor differences from those used for conterminous United States. The detailed data and description of concepts for 1940 may be found in *1940 Census of Housing, General Characteristics, Hawaii*.

Statistics on the number of occupied units and population per unit, which are essentially comparable with current data, are available from the Censuses of Population from 1930 back to 1900; in these reports, statistics are shown in terms of "homes," "families," or "private families." Counts of units by tenure are available from 1930 back to 1900, and counts of owned units that were encumbered are available from the Censuses of Population from 1920 back to 1900. Statistics on the number of dwellings and persons to a dwelling also are available from 1900 to 1930, the concept of "dwelling" being essentially comparable with the current concept of "structure." The concepts are essentially the same as those for conterminous United States. Data for 1930 and earlier may be found in the reports of the censuses of population for Hawaii.

Statistics by urban-rural residence (but not farm-nonfarm) are available for 1950. For earlier censuses, however, housing characteristics are not available by urban-rural or farm-nonfarm residence.

1960 PUBLICATION PROGRAM

Final housing reports.—Results of the 1960 Census of Housing are published in Volumes I to VII and in a joint housing and population series consisting of reports for census tracts. A series of special reports for local housing authorities constitutes the

remainder of the final reports. Volumes I to IV and the census tract reports are issued as series of individual reports, with Volumes I and II issued also as bound volumes. Volumes V to VII are issued only as bound volumes.

The source of Volumes I, II, III, VI, and VII and the housing data in the census tract reports is the April enumeration of the 1960 Census of Housing. The special reports for local housing authorities are based on results of the April enumeration and, for most areas, on data collected at a later date for nonsample households.

Data for Volumes IV and V are based largely on the enumeration of units in a sample of land area segments, started in late 1959 and completed in 1960. The 17 selected metropolitan areas referred to in the description of the volumes (see page v) consist of the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas and the following standard metropolitan statistical areas: Atlanta, Boston, Dallas, Detroit, Los Angeles-Long Beach, Philadelphia, Seattle, Baltimore, Buffalo, Cleveland, Minneapolis-St. Paul, Pittsburgh, St. Louis, San Francisco-Oakland, and Washington, D.C.-Md.-Va. The first nine areas named (the two standard consolidated areas and seven standard metropolitan statistical areas) are the areas for which separate data are included in Part 2 of Volume IV.

The titles and contents of the reports are described on page v. For the most part, they are comparable to the reports published from the 1950 Census of Housing. The 1960 Volumes I, II, and VI are similar to 1950 Volumes I, II, and III, respectively. Volume III of 1960 corresponds to the series of reports on block statistics which constituted 1950 Volume V. Volume IV of 1960 has no 1950 counterpart but corresponds to Volumes I and III of the 1956 National Housing Inventory. Volume V of 1960 corresponds to Volume IV of 1950 and, in part, to Volume II of the 1956 National Housing Inventory. In 1950, census tract reports were published as Volume III of the 1950 Census of Population. Special reports for local housing authorities were published for 219 areas in *1950 Census of Housing, Series HC-6, Special Tabulations for Local Housing Authorities*. Data of the type presented in 1960 Volume VII have not been published in previous census reports.

As stated on page v, data for the United States, regions, divisions, States, SMSA's, and large urban places are published in several series of housing reports. In some reports, cross-tabulations of housing and household characteristics are provided. Data for small areas, except for city blocks and census tracts, are restricted largely to those published in Volume I.

Preliminary and advance reports.—Statistics for many of the subjects covered in the census were released in several series of preliminary and advance reports. The figures in the preliminary and advance reports are superseded by the data in the final reports.

Population reports.—Population data are available for approximately the same types of areas that are covered in Volume I of the 1960 Housing reports. The data are published in chapters A, B, C, and D which constitute *1960 Census of Population, Volume I, Characteristics of the Population*. For the United States and regions, detailed cross-classifications are provided in *1960 Census of Population, Volume II, Subject Reports*, (Series PC(2) reports). Some of the reports in Volume II include data for States and SMSA's also. A more complete description of the publication program of the 1960 Census of Population may be found in any of the population reports.

AVAILABILITY OF UNPUBLISHED DATA

During the processing of the data for publication of Volume I, more data were tabulated than it was possible to print in the final reports. Some of the unpublished data from the April 1960 enumeration are for small areas such as enumeration districts, census tracts, and minor civil divisions in untraced areas. A

limited amount of additional data for housing units with non-white household heads has been tabulated but not published. For the larger areas (including SMSA's, States, divisions, regions, and the United States), virtually all the data that have been tabulated are published.

Photocopies of unpublished data can be provided at cost. Certain special tabulations can be prepared on a reimbursable basis. Requests for photocopies or for additional information should be addressed to Chief, Housing Division, Bureau of the Census, Washington 25, D.C.

AREA CLASSIFICATIONS

URBAN-RURAL RESIDENCE

In general, urban housing comprises all housing units in urbanized areas and in places of 2,500 inhabitants or more outside urbanized areas. More specifically, according to the definition used in the 1960 Census, urban housing comprises all housing in (a) places of 2,500 inhabitants or more incorporated as cities, boroughs, villages, and towns (except towns in New England, New York, and Wisconsin); (b) the densely settled urban fringe, whether incorporated or unincorporated, of urbanized areas (see section on "Urbanized areas"); (c) towns in New England and townships in New Jersey and Pennsylvania which contain no incorporated municipalities as subdivisions and have either 25,000 inhabitants or more or a population of 2,500 to 25,000 and a density of 1,500 persons or more per square mile; (d) counties in States other than the New England States, New Jersey, and Pennsylvania that have no incorporated municipalities within their boundaries and have a density of 1,500 persons or more per square mile; and (e) unincorporated places of 2,500 inhabitants or more (see section on "Places").

Housing not classified as urban constitutes rural housing. Rural housing comprises a variety of residences, such as isolated homes in the open country and homes in small villages and environs of cities outside urbanized areas.

The 1960 definition of urban is substantially the same as that used in 1950; the major difference between the two is the designation in 1960 of urban towns in New England and of urban townships in New Jersey and Pennsylvania. The effect on housing classification arising from this change was actually small because, in 1950, most of the housing in such places was classified as urban by virtue of its location in an urbanized area or in an unincorporated urban place. In censuses prior to 1950, urban housing comprised all housing in incorporated places of 2,500 inhabitants or more and areas (usually minor civil divisions) classified as urban under somewhat different special rules relating to population size and density. The net effect of the earlier definition on population counts has been measured and is published in *1960 Census of Population, Volume I, Characteristics of the Population*.

The most important component of the urban territory is the group of incorporated places having 2,500 inhabitants or more. A definition of urban territory restricted to such places, however, would exclude a number of equally large and densely settled places merely because they are not incorporated places. Under the definition used previous to 1950, an effort was made to avoid some of the more obvious omissions by the inclusion of selected places which were classified as urban under special rules. Even with these rules, however, many large and closely built-up places were excluded from the urban territory.

To improve its measure of urban housing the Bureau of the Census adopted, in 1950, the concept of the urbanized area and defined the larger unincorporated places as urban. All housing in urban-fringe areas and in unincorporated places of 2,500 or more was classified as urban in 1950 as well as in 1960. The urban towns, townships, and counties as defined for the 1960 Census are somewhat similar in concept to the minor civil divisions classified as urban under special rules in 1940 and 1930.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. Alaska is divided into 24 election districts, which are included in Volume I as the equivalents of counties. There are also a number of cities which are independent of any county organization and thus constitute primary divisions of their States, namely, Baltimore in Maryland, St. Louis in Missouri, and 32 cities in Virginia. The District of Columbia, which is not divided into counties, also is considered the equivalent of a county, as are the three parts of Yellowstone National Park in Idaho, Montana, and Wyoming. There were 3,072 counties and parishes in the United States in 1960 and 62 county equivalents, making a total of 3,134.

The number of counties declined by three between 1950 and 1960. Armstrong County, S. Dak., was annexed by Dewey County; Elizabeth City County, Va., was consolidated with Hampton city; and Warwick County, Va., was consolidated with Newport News city. The number of county equivalents in conterminous United States increased by five. Five cities in Virginia—Covington, Galax, Norton, South Boston, and Virginia Beach—became independent of county organization during the decade. Alaska was redistricted after 1950, and its judicial divisions were replaced by 24 election districts. Changes in the number of counties were fairly frequent some decades ago but have become progressively rarer. These changes, as well as changes of county boundaries, are listed in the notes to tables 6 and 7 in chapter A of the State parts of *1960 Census of Population, Volume I, Characteristics of the Population*.

PLACES

The term "place" as used in reports of the decennial censuses refers to a concentration of population, regardless of the existence of legally prescribed limits, powers, or functions. Most of the places are incorporated as cities, towns, villages, or boroughs, however. In addition, the larger unincorporated places outside the urbanized areas were delineated and they are presented in the same manner as incorporated places of equal size. Furthermore, unincorporated places within urbanized areas are identified if they have 10,000 inhabitants or more and if there was an expression of local interest in their recognition. Finally, the towns in New England and townships in New Jersey and Pennsylvania recognized as urban are also considered places (designated in the tables by "UT"). In the State chapters, data are presented for (a) incorporated places of 1,000 inhabitants or more, whether outside or inside urbanized areas, (b) unincorporated places of 1,000 inhabitants or more outside urbanized areas, (c) unincorporated places of 10,000 inhabitants or more inside urbanized areas, and (d) those towns, townships, and counties recognized as urban. Statistics for places of 100,000 inhabitants or more are provided in the United States Summary chapter.

Political units recognized as incorporated places in the reports of the decennial censuses are those which are incorporated as cities, boroughs, towns, and villages with the exception that towns are not recognized as incorporated places in the New England States, New York, and Wisconsin. The towns in these States are minor civil divisions similar to the townships found in other States and not necessarily thickly settled centers of population

such as the cities, boroughs, towns, and villages in other States. Similarly, in New Jersey and Pennsylvania, where some townships possess powers and functions similar to those of incorporated places, the townships are not classified as "incorporated places." Thus some minor civil divisions which are "incorporated" in one legal sense of the word are not regarded by the Census Bureau as "incorporated places." Without this restriction all of the towns in the New England States, New York, and Wisconsin and the townships in New Jersey and Pennsylvania would be counted as incorporated places without any consideration of the nature of population settlement. A number of towns and townships in these States do qualify, however, as urban towns or townships and in others the densely settled portions are recognized as unincorporated places or as parts of an urban fringe.

In most States, the incorporated places form subdivisions of the minor civil divisions in which they are located. In other States, however, all or some of the incorporated places are themselves also minor civil divisions. St. Louis, Baltimore, and 32 cities in Virginia (as of 1960) were independent of any county organization. In a number of instances such as Philadelphia, New Orleans, and San Francisco, the incorporated place is coextensive with the county in which it is located. New York City, on the other hand, is made up of five counties. An incorporated place may be located in two or more minor civil divisions or in two or more counties. Since, however, incorporated places are chartered by a State, no place can be located in two States, and adjoining places of the same name in two States are quite separate incorporations.

In the 1960 Census, 18,088 incorporated places were recognized (18,054 in conterminous United States). Of these places, 5,911 were cities, 1,214 were boroughs, 6,085 were towns, and 4,878 were villages. In addition, 125 urban towns and townships and 1 urban county were recognized as places. Of the 18,088 incorporated places, 9,874 had a population of less than 1,000; no separate data for the places under 1,000 are provided in the 1960 Housing reports. In the 1950 Census, 17,145 incorporated places were recognized (17,118 in conterminous United States), of which 9,843 had a population of less than 1,000.

As in the 1950 Census, the Bureau delineated, in advance of enumeration, boundaries for densely settled population centers without corporate limits. Each unincorporated place (designated in the tables by "U") possesses a definite nucleus of residences and has its boundaries drawn so as to include, if feasible, all the surrounding closely settled areas. In 1950, only those unincorporated places outside urbanized areas were recognized in the census. Incorporated places were identified whether inside or outside urbanized areas. In the 1960 Census, 1,576 unincorporated places of 1,000 inhabitants or more were recognized (1,528 in conterminous United States). In the 1950 Census, the corresponding count was 1,470 (1,430 in conterminous United States).

The figures for a given place apply to the housing within the boundaries of the place at the time of the census. Hence, the indicated change from 1950 to 1960 reflects the effect of any annexations or detachments. There were a great many annexations to cities in the decade of the 1950's, and some of them involved large areas. To permit an analysis of the importance of the change in boundaries, population figures for the 1950 area and for annexed areas of incorporated places are shown in table 9 in chapter A of the State parts of *1960 Census of Population, Volume I, Characteristics of the Population*. For unincorporated places, the boundaries in many instances have changed as the communities have expanded.

URBANIZED AREAS

The major objective of the Bureau of the Census in delineating urbanized areas was to provide a better separation of ur-

ban and rural housing in the vicinity of the larger cities, but individual urbanized areas have proved to be useful statistical areas also. They correspond to what are called "conurbations" in some other countries. An urbanized area contains at least one city of 50,000 inhabitants or more in 1960,¹ as well as the surrounding closely settled incorporated places and unincorporated areas that meet the criteria listed below. An urbanized area may be thought of as divided into the central city, or cities, and the remainder of the area, or the urban fringe. All housing in an urbanized area is included in urban housing. Statistics for urbanized areas appear in the State chapters of Volume I. A map of each urbanized area in a State, if any, appears at the end of the State chapter, and the counties or parts of counties in which each area is located are listed on page 2 of the State chapter. In the 1960 Census, 213 urbanized areas were identified in the United States.

It appeared desirable to delineate the urbanized areas in terms of the 1960 Census results rather than on the basis of information available prior to the Census as was done in 1950. For this purpose a peripheral zone around each 1950 urbanized area and around cities that were presumably approaching a population of 50,000 was recognized. Within the unincorporated parts of this zone small enumeration districts were planned, usually including no more than one square mile of land area and no more than 75 housing units.²

Arrangements were made to include within the urbanized area those enumeration districts meeting specified criteria of population density as well as adjacent incorporated places. Since the urbanized area outside incorporated places was defined in terms of enumeration districts, the boundaries of the urbanized area for the most part follow such features as roads, streets, railroads, streams, and other clearly defined lines which may be easily identified by census enumerators in the field and often do not conform to the boundaries of political units.

In addition to its central city or cities, an urbanized area contains the following types of contiguous areas which together constitute its urban fringe:

1. Incorporated places with 2,500 inhabitants or more.
2. Incorporated places with less than 2,500 inhabitants, provided each has a closely settled area of 100 housing units or more.
3. Towns in the New England States, townships in New Jersey and Pennsylvania, and counties elsewhere which are classified as urban.
4. Enumeration districts in unincorporated territory with a population density of 1,000 inhabitants or more per square mile. (The areas of large nonresidential tracts devoted to such urban land uses as railroad yards, factories, and cemeteries were excluded in computing the population density of an enumeration district.)
5. Other enumeration districts in unincorporated territory with lower population density provided that they served one of the following purposes:
 - a. To eliminate enclaves.
 - b. To close indentations in the urbanized areas of one mile or less across the open end.
 - c. To link outlying enumeration districts of qualifying density that were no more than 1½ miles from the main body of the urbanized area.

A single urbanized area was established for cities in the same standard metropolitan statistical area if their fringes adjoin. Urbanized areas with central cities in different standard metropolitan statistical areas are not combined, except that a

¹ There are a few urbanized areas where there are "twin central cities" neither of which has a population of 50,000 or more but that have a combined population of at least 50,000. See the section below on "Standard metropolitan statistical areas" for further discussion of twin central cities.

² An enumeration district (ED) is a small area assigned to an enumerator which must be canvassed and reported separately. The average ED contains approximately 200 housing units.

single urbanized area was established in the New York-Northeastern New Jersey Standard Consolidated Area and in the Chicago-Northwestern Indiana Standard Consolidated Area.

Relation to earlier censuses.—Urbanized areas were first delineated for the 1950 Census. In 1950, urbanized areas were established in connection with cities having 50,000 inhabitants or more according to the 1940 Census of Population or a later census prior to 1950; in 1960, urbanized areas were established in connection with cities having 50,000 inhabitants or more according to the 1960 Census of Population. For the 1950 Census, 157 urbanized areas were identified (the identification being restricted to conterminous United States).

The boundaries of the urbanized areas for 1960 do not conform to those for 1950, partly because of actual changes in land use and density of settlement, and partly because of relatively minor changes in the rules used to define the boundaries. The changes in the rules were made in order to simplify the process of defining the boundaries; as a result of the changes, the area classified as urbanized tends to be somewhat larger than it would have been under the 1950 rules. The changes include the following:

1. The use of enumeration districts to construct the urbanized areas in 1960 resulted in a less precise definition than in 1950 when the limits were selected in the field using an individual city-type block as the unit of area added. On the other hand, the 1960 procedures produced an urbanized area based on the census results rather than an area defined about a year before the census, as in 1950.

2. Unincorporated territory was included in the 1960 urbanized area if it contained at least 1,000 persons per square mile, which is a somewhat different criterion from the 500 or more dwelling units per square mile of the included 1950 unincorporated areas.

3. The 1960 areas include those entire towns in New England, townships in New Jersey and Pennsylvania, and counties that are classified as urban in accordance with the criteria listed in the section on urban-rural residence. The 1950 criteria permitted the exclusion of portions of these particular minor civil divisions.

In general, however, the urbanized areas of 1950 and 1960 are based on essentially the same concept, and the figures for a given urbanized area may be used to measure the housing growth of that area.

Relation to standard metropolitan statistical areas.—Any city in an urbanized area which is a central city of a standard metropolitan statistical area (SMSA) is also a central city of the urbanized area. With but two exceptions, the names of the central cities appear in the titles of the areas. The central cities of the New York-Northeastern New Jersey Urbanized Area are the central cities of the New York, Newark, Jersey City, and Paterson-Clifton-Passaic Standard Metropolitan Statistical Areas. Likewise, the central cities of the Chicago-Northwestern Indiana Urbanized Area are the central cities of the Chicago and Gary-Hammond-East Chicago Standard Metropolitan Statistical Areas.

The urbanized area can be characterized by the physical city as distinguished from both the legal city and the metropolitan community. In most cases, urbanized areas are smaller than SMSA's and are contained in SMSA's. However, in a few instances, the fact that the boundaries of SMSA's are determined by county lines and those of urbanized areas by the pattern of urban growth means that there are small segments of urbanized areas which lie outside SMSA's. In general, then, urbanized areas represent the thickly settled portions of SMSA's. Because of discontinuities in land settlement, there are also some cases in which a single SMSA contains several urbanized areas.

Areas crossing State lines.—Like standard metropolitan statistical areas, urbanized areas are not confined within State boundaries, nor within region or division boundaries. For urbanized areas which cross State lines, statistics are shown only in the chapter for the State in which a central city is located.

STANDARD METROPOLITAN STATISTICAL AREAS

It has long been recognized that for many types of analysis it is necessary to consider as a unit the entire area, in and around a city, in which the activities form an integrated economic and social system. Prior to the 1950 Census, areas of this type had been defined in somewhat different ways for different purposes and by various agencies. Leading examples were the metropolitan districts of the 1940 Census of Housing, the industrial areas of the Census of Manufactures, and the labor market areas of the Bureau of Employment Security. To permit all Federal statistical agencies to utilize the same areas for the publication of general-purpose statistics, the Bureau of the Budget has established "standard metropolitan statistical areas" (SMSA's). Every city of 50,000 inhabitants or more according to the 1960 Census of Population is included in an SMSA.

The definitions and titles of standard metropolitan statistical areas are established by the Bureau of the Budget with the advice of the Federal Committee on Standard Metropolitan Statistical Areas. This Committee is composed of representatives of the major statistical agencies of the Federal Government. The criteria used by the Bureau of the Budget in establishing the SMSA's are presented below. (See the Bureau of the Budget publication *Standard Metropolitan Statistical Areas*, U.S. Government Printing Office, Washington 25, D.C., 1961.)

The definition of an individual standard metropolitan statistical area involves two considerations: First, a city or cities of specified population to constitute the central city and to identify the county in which it is located as the central county; and second, economic and social relationships with contiguous counties which are metropolitan in character, so that the periphery of the specific metropolitan area may be determined.³ Standard metropolitan statistical areas may cross State lines.

Population criteria.—The criteria for population relate to a city or cities of specified size according to the 1960 Census of Population.

1. Each standard metropolitan statistical area must include at least:

- a. One city with 50,000 inhabitants or more, or
- b. Two cities having contiguous boundaries and constituting, for general economic and social purposes, a single community with a combined population of at least 50,000, the smaller of which must have a population of at least 15,000.

2. If each of two or more adjacent counties has a city of 50,000 inhabitants or more (or twin cities under 1b) and the cities are within 20 miles of each other (city limits to city limits), they will be included in the same area unless there is definite evidence that the two cities are not economically and socially integrated.

Criteria of metropolitan character.—The criteria of metropolitan character relate primarily to the attributes of the contiguous county as a place of work or as a home for a concentration of nonagricultural workers.

3. At least 75 percent of the labor force of the county must be in the nonagricultural labor force.⁴

4. In addition to criterion 3, the county must meet at least one of the following conditions:

- a. It must have 50 percent or more of its population living in contiguous minor civil divisions⁵ with a density of at least 150

³ Central cities are those appearing in the standard metropolitan statistical area title. A "contiguous" county either adjoins the county or counties containing the largest city in the area, or adjoins an intermediate county integrated with the central county. There is no limit to the number of tiers of outlying metropolitan counties so long as all other criteria are met.

⁴ Nonagricultural labor force is defined as those employed in nonagricultural occupations, those experienced unemployed whose last occupation was a nonagricultural occupation, members of the Armed Forces, and new workers.

⁵ A contiguous minor civil division either adjoins a central city in a standard metropolitan statistical area or adjoins an intermediate minor civil division of qualifying population density. There is no limit to the number of tiers of contiguous minor civil divisions so long as the minimum density requirement is met in each tier.

persons per square mile, in an unbroken chain of minor civil divisions with such density radiating from a central city in the area.

b. The number of nonagricultural workers employed in the county must equal at least 10 percent of the number of nonagricultural workers employed in the county containing the largest city in the area, or the county must be the place of employment of 10,000 nonagricultural workers.

c. The nonagricultural labor force living in the county must equal at least 10 percent of the number in the nonagricultural labor force living in the county containing the largest city in the area, or the county must be the place of residence of a nonagricultural labor force of 10,000.

5. In New England, the city and town are administratively more important than the county, and data are compiled locally for such minor civil divisions. Here, towns and cities are the units used in defining standard metropolitan statistical areas. In New England, because smaller units are used and more restricted areas result, a population density criterion of at least 100 persons per square mile is used as the measure of metropolitan character.

Criteria of integration.—The criteria of integration relate primarily to the extent of economic and social communication between the outlying counties and central county.

6. A county is regarded as integrated with the county or counties containing the central cities of the area if either of the following criteria is met:

a. Fifteen percent of the workers living in the county work in the county or counties containing central cities of the area, or

b. Twenty-five percent of those working in the county live in the county or counties containing central cities of the area.

Only where data for criteria 6a and 6b are not conclusive are other related types of information used as necessary. This information includes such items as average telephone calls per subscriber per month from the county to the county containing central cities of the area; percent of the population in the county located in the central city telephone exchange area; newspaper circulation reports prepared by the Audit Bureau of Circulation; analysis of charge accounts in retail stores of central cities to determine the extent of their use by residents of the contiguous county; delivery service practices of retail stores in central cities; official traffic counts; the extent of public transportation facilities in operation between central cities and communities in the contiguous county; and the extent to which local planning groups and other civic organizations operate jointly.

Criteria for titles.—The criteria for titles relate primarily to the size and number of central cities.

7. The complete title of an SMSA identifies the central city or cities and the State or States in which the SMSA is located:

a. The name of the standard metropolitan statistical area includes that of the largest city.

b. The addition of up to two city names may be made in the area title, on the basis and in the order of the following criteria:

(1) The additional city has at least 250,000 inhabitants.

(2) The additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000, except that both city names are used in those instances where cities qualify under criterion 1b. (A city which qualified as a secondary central city in 1950 but which does not qualify in 1960 has been temporarily retained as a central city.)

c. In addition to city names, the area titles will contain the name of the State or States in which the area is located.

Inside and outside SMSA's.—Separate figures for housing units inside and outside SMSA's are provided for the United States as a whole, each region, and each geographic division in the United States Summary chapter, and for each State in the State chapters of Volume I. The statistics for housing units "inside SMSA's" for the total United States are for the total of the 212 SMSA's in the United States. Similarly, the statistics for "inside SMSA's" for a region, division, or State are for the total of the SMSA's, or parts of SMSA's, within the respective region, division, or State.

Statistics for each of the 212 SMSA's are provided in the State chapters of Volume I; and statistics for each of the 190 SMSA's of 100,000 inhabitants or more are provided in the United States Summary chapter. A map showing the location and boundaries of SMSA's within a State, if any, is included in the individual chapter for the State, and the constituent parts of the SMSA's are listed on page 2 of the respective State chapters. A map showing the location and names of all the SMSA's in the United States is included in the United States Summary chapter.

SMSA's crossing State lines.—In the State chapters, data for SMSA's are shown in tables 12 to 17. For SMSA's that cross State lines, the full detail is shown in the chapter for each State in which a central city is located. In the State not containing a central city, the detail is shown only for the portion of the SMSA located in that State, with a total column for the portion in the other State (or States) and a total column for the entire SMSA. In table 1 of the State chapters, only the total for the entire SMSA and the portion for that State are given; in tables 8 and 36 to 42, the figures for the entire SMSA are shown in the chapter for each State containing part of an SMSA.

Relation to earlier censuses.—In 1950, data were presented for standard metropolitan areas (SMA's) which were established in connection with cities of 50,000 inhabitants or more in 1950. In 1940, a somewhat similar type of area called the "metropolitan district" was used. In 1958, the criteria for delineating SMA's were revised by the Bureau of the Budget, and in 1959 the areas were designated as standard metropolitan statistical areas (SMSA's). In some cases, the 1960 SMSA has the same boundaries as the 1950 SMA; in others, parts have been added or deleted. The designation of the central cities also has changed for some areas. The relationship can be readily determined by comparing the 1960 and 1950 boundaries for the particular area.

In 1950, a total of 168 standard metropolitan areas were identified in conterminous United States, and the Honolulu SMA was identified in Hawaii. A few of the 1950 SMA's were split into several SMSA's for 1960. Some entirely new SMSA's were added to the metropolitan territory of the existing SMA's; in terms of the 1950 counts, the net addition resulting from the designation of new metropolitan territory and changes in boundaries amounted to approximately 6 percent of the total units in the 1950 SMA's. In the text tables in the United States Summary chapter, 1950 data for "inside SMSA's" are for the 212 areas as defined for the 1960 Census; 1950 data for "in central cities" are for the central cities as defined for the 1960 SMSA's but with no adjustment for changes in city limits since 1950.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former is identical with the New York-Northeastern New Jersey SMA of 1950, and the latter corresponds roughly to the Chicago SMA of 1950 (two more counties having been added).

Data for the standard consolidated areas appear only in the chapters for New York and New Jersey and in the chapters for Illinois and Indiana. The constituent parts of the areas are listed on page 2 of the respective chapters. The New York-Northeastern New Jersey Standard Consolidated Area comprises four SMSA's and two additional counties; the Chicago-Northwestern Indiana Standard Consolidated Area comprises two SMSA's.

DEFINITIONS AND EXPLANATIONS

The definitions and explanations of terms should be interpreted in the context of the 1960 Census procedures for collecting the data. Data were collected by a combination of self-enumeration, direct interview, and observation by the enumerator.

Items to be filled through self-enumeration appeared on forms which were supplied to households with the request that the household members themselves complete them. A few of the questions appeared on the Advance Census Report (ACR), which was to be filled and held until the enumerator called. Most of the questions, however, appeared on the Household Questionnaire,⁶ which was to be filled and mailed directly to the census office. In completing the self-enumeration items, the respondent had the explanations and wording that were printed on the forms. His answers were accepted unless the enumerator found it necessary to clarify or correct them.

If the self-enumeration form was not filled or if the answers were incomplete or inconsistent, the enumerator obtained the information through direct interview and recorded it directly on a FOSDIC schedule, a form specially designed for electronic data processing (see section on "Collection and processing of data"). The enumerator was instructed to read the questions from the FOSDIC schedule and record the replies as given. If the respondent did not understand a question, the enumerator was to explain it based on his understanding of the definitions and instructions in the Enumerator's Reference Manuals. If the respondent's replies were incomplete or inconsistent, the enumerator was instructed to ask additional questions.

Information for vacant units was obtained by the enumerator largely from owners, landlords, neighbors, or other persons presumed to know the situation and the enumerator recorded the information directly on the FOSDIC schedules. A few items, including condition of unit, were always determined by the enumerator on the basis of his observation and, therefore, did not appear among the self-enumeration items.

The intent of the questions on the two types of forms is the same, although the wording of some of the questions and response categories on the direct-interview forms is briefer than on the self-enumeration forms. Furthermore, the direct-interview forms omit many of the instructions given on the self-enumeration forms. The differences, however, probably do not contribute in any important way to a lack of comparability of the data obtained from the two methods of enumeration. Through the use of the self-enumeration forms, respondents were given more uniform explanations of some of the questions than would have been possible in direct interview. On the other hand, the less detailed wording on the direct-interview forms was supplemented by the instructions given to the enumerator.

The questions and response categories used in self-enumeration compared with those used by the enumerator in direct interview are exhibited in the sections which follow. A general explanation appeared on the self-enumeration forms to the effect that the term "house" or "apartment" covered the house or part of the house the respondents occupied, or the apartment, flat, or rooms in which they lived. The explanation also pointed out that items on year built, sewage disposal, basement, and elevator in structure pertained to the whole building in which the respondents lived. In using the direct-interview forms, the enumerator was instructed to substitute an appropriate term for the word "unit," such as "house," "apartment," "flat," or "rooms." The procedural instructions and the arrangement and sequence of the questions as they appeared on the forms are illustrated in the appendix to the United States Summary chapter of Volume I.

⁶ The Household Questionnaire was used only in areas where the two-stage enumeration procedure was followed. In single-stage areas, these items were filled through direct interview. See section on "Collection and processing of data."

The definitions that follow conform to those provided in the Enumerator's Reference Manuals. They indicate the concept that was intended, whether the information was provided through self-enumeration or obtained by direct interview. Definitions from the 1950 and earlier censuses also indicate the concepts that were intended, with direct interview as the method of enumeration. Excerpts of instructions from the 1960 Enumerator's Reference Manuals are contained in the appendix to the United States Summary chapter of Volume I. For the most part, the excerpts do not include instructions for items to be filled by self-enumeration.

Instructions from the 1950 Enumerator's Reference Manual, and the schedule used in the enumeration, are reproduced in the appendix to the United States Summary chapter of *1950 Census of Housing, Volume I, General Characteristics*.

Some of the definitions used in 1960 differ from those used in 1950 and earlier, as indicated below in the explanations of the items. These changes were made after consultation with users of housing census data to improve the statistics even though it was recognized that comparability would be affected. Statements on comparability with 1950 and earlier censuses do not always apply specifically to Alaska and Hawaii; the subjects and concepts applicable to the censuses in these two States are discussed in the section "Housing data for Alaska and Hawaii."

As in all surveys, there were some failures to execute the instructions exactly, regardless of the enumeration procedures applied, and some erroneous interpretations have undoubtedly gone undetected.

LIVING QUARTERS

Living quarters were enumerated as housing units or group quarters. Usually a housing unit is a house, apartment, or flat. However, it may be a trailer or a room in a hotel. A structure intended primarily for business or other nonresidential use may also contain a housing unit; for example, the rooms in a warehouse where the watchman lives, or the living quarters of a merchant in back of his shop. Group quarters are found in institutions, dormitories, barracks, rooming houses, and other places where the occupants do not have separate living arrangements.

Housing unit.—A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants of the unit. The occupants of a housing unit may be a family or other group of persons, or a person living alone.

Trailers, tents, boats, and railroad cars are included in the housing inventory if they are occupied as housing units. They are excluded if they are vacant, used only for extra sleeping space or vacations, or used only for business. Hotel accommodations are housing units if they are the usual residence of the occupants.

Both vacant and occupied housing units are included in the housing inventory. Vacant quarters are excluded, however, if they are still under construction, being used for nonresidential purposes, unfit for human habitation, condemned, or scheduled for demolition (see section on "Vacant housing unit").

Determination of housing unit.—Occupied living quarters were classified as housing units on the basis of information supplied by household members on the Advance Census Report (ACR) and questions asked by the enumerator where necessary. Identification of vacant housing units was determined by the enumerator, through observation and questions asked of the owners, landlords, or neighbors.

HOUSING UNIT DETERMINATION

Self-enumeration

- a. Does more than one family live in this home?
Yes ☐ No ☐
- b. (If yes) Do they live and eat with your family?
Yes ☐ No ☐
- c. Please be sure to list—
All members of your family living with you, including babies.
All other relatives living here.
Lodgers and boarders living here.
Servants, hired hands, others not related to you who are living here.
Anyone else staying here but who has no other home.

Direct interview

- a. Does more than one family live in this home?
- b. (If yes) Do they live and eat with the family, or do they have separate quarters?
- c. What is the name of the head of this household?
What are the names of all other persons who live here?
(Before listing "other relatives" or "nonrelatives," find out if they have separate quarters.)

Determination by enumerator

- d. Access to unit
Direct from outside or common hall..... ☐
Through another unit..... ☐

Direct interview

- e. Do you have a kitchen or cooking equipment—
For use of the people in your household only (those you listed)..... ☐
Shared with another household or no cooking equipment..... ☐
- f. Does anyone else live in this building or anywhere else on this property?
Yes ☐ No ☐
- g. As far as you know, are there any vacant apartments or vacant rooms for rent in this building or elsewhere on this property?
Yes ☐ No ☐
- e. Kitchen or cooking equipment
For exclusive use..... ☐
Shared or none..... ☐
- f. Does anyone else live in this building or elsewhere on this property?
- g. Are there any vacant apartments or any vacant rooms for rent?
- h. (Ask about next unit) Name?
No. of people? When home?
(If vacant) Whom to see?

In filling the ACR, the respondent made the initial determination of the housing unit. The final determination was made by the enumerator as he followed the procedure outlined on the FOSDIC schedule. The decision as to what constituted a housing unit was made on the basis of the living arrangements of the occupants and not on relationship.

Some of the questions on the FOSDIC schedule parallel those on the self-enumeration form (ACR) as indicated below. For these questions, the enumerator referred to the ACR for the answers. If only one family lived in the house, the enumerator regarded the quarters as one housing unit and no further probing was necessary to determine whether the quarters were "separate" quarters. (In such cases, direct access and separate cooking facilities were regarded as characteristics of the housing unit rather than criteria of separateness.) If there was evidence of additional separate quarters, such as a second mailbox or doorbell, or the presence of other relatives or nonrelatives, the enumerator was to determine whether there were additional housing units on the basis of either direct access or separate cooking facilities. Quarters that did not meet either criterion were not considered sufficiently separate to qualify as housing units. Quarters whose occupants shared living arrangements were combined into one housing unit (unless the combined quarters contained five or more persons unrelated to the head, in which case the quarters were considered group quarters).

As a final step in the determination of separate housing units, the enumerator was instructed to take account of the respondent's answers to questions about other quarters on the property.

Living quarters are regarded as having *direct access* if the entrance is direct from the outside of the structure, or through a common hall, lobby, or vestibule used by the occupants of more than one unit. The hall, lobby, or vestibule must not be part of any unit, but must be clearly separate from all units in the structure. Living quarters have access through another unit when the only entrance to the room or rooms is through a room or hall which is part of the other unit.

A *kitchen* is defined as a room used primarily for cooking and the preparation of meals. *Cooking equipment* is defined as (1) a range or stove, whether or not it is regularly used, or (2) other equipment such as a hotplate or electrical appliance if it is used for the regular preparation of meals. Equipment is for exclusive use if it is used only by the occupants of one unit (see also section on "Exclusive or shared use"). Vacant units are considered to have cooking equipment if the last occupants had such equipment.

Hotel, motel.—Occupied rooms or suites of rooms in hotels, motels, and similar places are classified as housing units only when occupied by usual residents, i.e., persons who consider the hotel as their usual place of residence or have no usual place of residence elsewhere. Vacant rooms or suites of rooms are classified as housing units only in those hotels in which 75 percent or more of the accommodations are occupied by usual residents. The 75-percent limit is an arbitrary rule, the intent being to exclude from the housing inventory those quarters usually occupied by transient guests.

The distinction between hotels and rooming houses in the 1960 Census was made by the enumerator generally on the basis of local usage.

Rooming house, boarding house.—If any of the occupants in a rooming or boarding house have separate quarters and do not share living arrangements with other occupants in the structure, such quarters are considered separate housing units. The remaining quarters are combined. If the combined quarters contain four or fewer roomers unrelated to the head, they are classified as one housing unit; if the combined quarters contain five or more roomers unrelated to the head or person in charge, they are classified as group quarters. In a dormitory, residence hall, nurses' home, or similar place, living quarters of the supervisory staff are separate housing units if they satisfy the housing unit criteria; other living quarters are considered group quarters.

Institution.—Living quarters of staff personnel are separate housing units if they satisfy the housing unit criteria. Other living quarters are considered group quarters (see section on "Group quarters").

Comparability with earlier censuses.—In 1950, the unit of enumeration was the dwelling unit. Although the definition of "housing unit" in 1960 is essentially similar to that of "dwelling unit" in 1950, the housing unit definition was designed to encompass all private living quarters, whereas the dwelling unit definition did not cover all private living accommodations. In 1950, a dwelling unit was defined as (1) a group of rooms occupied or intended for occupancy as separate living quarters and having either separate cooking equipment or separate entrance; or (2) a single room occupied or intended for occupancy as separate quarters if (a) it had separate cooking equipment, (b) it was located in a regular apartment house, or (c) it constituted the only living quarters in the structure.

The main difference between housing units and dwelling units is in the treatment of one-room quarters. In 1960, *separate* living quarters consisting of one room with direct access but without separate cooking equipment qualify as a housing unit whether in an apartment house, rooming house, or house converted to apartment use. In hotels in 1960, a single room qualifies as a housing unit if occupied by a person whose usual residence is the hotel or a person who has no usual residence elsewhere; a vacant room (including quarters temporarily occupied by a nonresident) qualifies as a housing unit only if 75 percent or more of the accommodations in the hotel are occupied by usual residents. In 1950, a one-room unit without separate cooking equipment qualified as a dwelling unit only when located in a regular apartment house or when the room constituted the only living quarters in the structure. In hotels in 1950, occupied and vacant quarters that satisfied the dwelling unit criteria were included in the housing inventory only if more than half the accommodations in the hotel were for permanent guests; if less than half, none of the quarters were included in the housing inventory.

Data on access and cooking facilities of one-room quarters are given in *1960 Census of Housing, Volume II, Metropolitan Housing*. As explained above, separate living quarters containing one room with direct access but having no separate cooking equipment were housing units in 1960 but would not have qualified as dwelling units by the 1950 definition unless they were located in a regular apartment house or were the only living quarters in the structure. Approximately one-half million occupied units, amounting to about 1 percent of the housing inventory in the United States as a whole, were 1-room units with direct access but with shared or no kitchen or cooking equipment

(table 8 of Volume II). For the most part, the units were renter occupied, and roughly four-fifths of them were located inside standard metropolitan statistical areas. It is not possible to determine what portion would qualify as "dwelling units" since there is no measure of the number of units in regular apartment houses or the number that are the only living quarters in the structure.

The evidence thus far suggests that the use of the housing unit concept in 1960 instead of the dwelling unit concept as in 1950 had relatively little effect on the counts for large areas and for the Nation. Any effect which the change in concept may have on comparability can be expected to be greatest in statistics for certain census tracts and blocks within metropolitan areas. Living quarters classified as housing units in 1960 but which would not have been classified as dwelling units in 1950 tend to be clustered in tracts and blocks where many persons live separately in single rooms in hotels, rooming houses, and other light housekeeping quarters. In such areas, the 1960 housing unit count for an individual tract or block may be higher than the 1950 dwelling unit count even though no units were added by new construction or conversion.

In the 1940 Census, a dwelling unit was defined as the living quarters occupied, or intended for occupancy, by one household. A household consisted of a family or other group of persons living together with common housekeeping arrangements, or a person living alone. The instructions to the enumerator did not explicitly define living quarters as separate units on the basis of cooking equipment or access. Furthermore, living quarters with five lodgers or more were included in the 1940 housing inventory but excluded in 1950 and 1960. Even though there were differences in the definitions used in each of the censuses, the overall effect of the change in definition is believed to be small. The differences, if any, would have the greatest effect on data for small areas such as census tracts or blocks.

Statistics on the number of occupied units (identified as "families" in the early censuses) are available from the Censuses of Population from 1930 back to 1890, with limited data back to 1850. The term "family" or "home" used in these censuses is essentially comparable with the current term "housing unit" (see section on "Occupied housing unit").

Comparability with 1959 Components of Inventory Change survey.—In the Components of Inventory Change survey, a sample survey conducted in December 1959 as part of the 1960 Census of Housing, the "dwelling unit" was the unit of enumeration, the dwelling unit being defined as in 1950 (see *1960 Census of Housing*, Volume IV, *Components of Inventory Change*, Part 1A-1, *United States and Regions*). The dwelling unit was used in the 1959 survey so that change between 1950 and 1959 could be measured on a unit-by-unit basis.

For the United States as a whole, the estimate of the number of dwelling units from the December 1959 sample survey is 58,468,000 and the count of housing units from the April 1960 Census is 58,326,000. For metropolitan areas, however, the count of housing units from the April 1960 enumeration for the 17 areas for which separate data are provided in Volume IV is slightly higher than the count of dwelling units from the December 1959 survey; there is evidence that this difference exists even after allowance for sampling variability of the 1959 estimate and dates of enumeration. Furthermore, the estimate from the April 1960 enumeration of the number of 1- and 2-room renter-occupied housing units in the 17 areas is higher than the estimate of dwelling units in the comparable category from the December 1959 survey.

As indicated above, the housing unit concept is more inclusive than the dwelling unit concept. The effect of the conceptual difference alone, however, may not be revealed by the results of two separate surveys or censuses. Other factors which affect comparability between the December 1959 and the April 1960 figures include the different enumeration procedures employed, the degree of overenumeration and underenumeration in both the survey and the census, the estimation procedure used for the 1959 results, and the sampling variability of the 1959 estimates. The results of the two enumerations are being evaluated in more detail to determine the relationship between the two concepts.

Group quarters.—Occupied quarters which do not qualify as housing units are considered group quarters. They are located most frequently in institutions, hospitals, nurses' homes, rooming and boarding houses, residential clubs, missions and flophouses, military and other types of barracks, college dormitories, fraternity and sorority houses, convents, and monasteries. Group quarters are also located in a house or apartment in which the

living quarters are shared by the head and five or more persons unrelated to him. Group quarters are not included in the housing inventory; therefore, counts and housing characteristics of such quarters are not reflected in the data in any of the housing reports. The 1960 concept of group quarters is similar to the 1950 concept of nondwelling-unit quarters.

According to the results of the 1960 Census of Population, approximately 4.9 million people or 2.8 percent of the total population of the United States lived in quarters not defined as housing units. In 1950, the number of persons whose quarters were not included in the dwelling unit inventory was 5.7 million or 3.8 percent of the total 1950 population. The 1950 figures are not entirely comparable with the 1960 figures; it is probable, due to the change in definition from "dwelling unit" to "housing unit," that some 1-room quarters which were housing units in 1960 would not have been dwelling units according to the 1950 definition.

OCCUPANCY CHARACTERISTICS

The questions used to ascertain occupancy characteristics of housing units are shown below. The items on persons, color, and tenure appeared as self-enumeration items on the Advance Census Report; the item on year moved and the questions related to farm-nonfarm residence for occupied units appeared as self-enumeration items on the Household Questionnaire, which was used in two-stage areas. The direct-interview questions appeared on the FOSDIO schedule. Vacancy status, duration of vacancy, and the number of acres in the place for vacant units were determined by the enumerator through information obtained from owners, landlords, or neighbors.

Occupied housing unit.—A housing unit is "occupied" if it is the usual place of residence of the person or group of persons living in it at the time of enumeration. Included are units occupied by persons who are only temporarily absent, such as persons on vacation. Units occupied by persons with no usual place of residence are also considered "occupied." For example, a unit occupied by migratory workers who have no usual residence elsewhere is considered occupied; however, if the migrants have a residence elsewhere, the unit in which they are temporarily living is classified as vacant.

A household consists of all the persons who occupy a housing unit. By definition, therefore, the count of occupied housing units is the same as the count of households in the 1960 Census of Population reports. In some cases, however, there are small differences in the counts resulting from processing procedures. (The ratio estimation procedure for population data was carried out for groups of persons on the basis of age, color, sex, head of household by tenure of unit, and nonhead; the estimation procedure for housing data was carried out for groups of housing units on the basis of tenure, color, and vacancy status; see section on "Ratio estimation.")

The same definition for classifying a unit as occupied was used in the 1950 and 1940 Censuses of Housing. The concept of occupied units in the Censuses of Population in 1930 and earlier, although identified as "homes," "families," or "private families," are also essentially comparable with the 1960 concept of occupied housing units (or households). The counts in some of the earlier censuses included group quarters (or quasi-family groups), with each institution, rooming house, and similar quarters counted as one unit.

Population in units.—The "population in housing units, 1960" is the total count of persons living in quarters classified as housing units; it excludes persons living in group quarters. The 1960 figure for "population per occupied unit" was computed by dividing the population in housing units by the number of occupied units. When this figure is tabulated from a sample, it is subject to some sampling variability (see section on "Sample design and sampling variability").

PERSONS, COLOR

Self-enumeration

P2. Names of persons living here on April 1, 1960, and those staying here who have no other home.

Write names in this order:

Head of household on first line.
Wife of head.
Unmarried children, oldest first.

Married children and their families.

Other relatives.

Others not related to head of household.

Direct interview

P2. Name—Enter last name first.

List persons in this order:

The head.
His wife.
Unmarried sons and daughters (in order of age).
Married sons and daughters and their families.
Other relatives.
Other persons, such as lodgers, maids, or hired hands who live in and their relatives living in.

Determination by enumerator

P5. Is this person—

White
Negro

FARM-NONFARM RESIDENCE

Self-enumeration

H17 and H18. Is this house—

On a city lot (or is this an apartment building)..... ☐

OR

On a place of less than 10 acres..... ☐

Last year (1959), did sales of crops, livestock, and other farm products from this place amount to \$250 or more?

\$250 or more..... ☐

Less than \$250 or none..... ☐

OR

On a place of 10 or more acres..... ☐

Last year (1959), did sales of crops, livestock, and other farm products from this place amount to \$50 or more?

\$50 or more..... ☐

Less than \$50 or none..... ☐

H42. Does your rent include any land used for farming (or ranching)?

Yes..... ☐ No..... ☐

Direct interview

H17. Is this house—

On a city lot (or apt. bldg.)..... ☐

On a place of less than 10 acres..... ☐

H18a. If occupied—Last year, 1959, did sales of crops, livestock and other farm products from this place amount to—

\$250 or more..... ☐

Less than \$250 (or none)..... ☐

On a place of 10 or more acres..... ☐

H18b. If occupied—Last year, 1959, did sales of crops, livestock and other farm products from this place amount to—

\$50 or more..... ☐

Less than \$50 (or none)..... ☐

H42. Does the rent include any land used for farming (or ranching)?

Yes..... ☐ No..... ☐

By definition, the population in housing units is the same as population in households in the reports of the 1960 Census of Population. In some cases, however, there are small differences resulting from processing procedures (see discussion of households in the section above on "Occupied housing unit").

The "population in dwelling units, 1950" is the 1950 population in quarters classified as dwelling units; and the "population per occupied unit" is computed in the same way as the 1960 figure. Although the concepts are similar, the change from "dwelling unit" to "housing unit" may have introduced an element of difference between the 1960 and 1950 figures in some areas.

The 1950 figures for places, urbanized areas, and counties in Volume I of the 1960 Housing reports are based on boundaries as of 1950. For individual SMSA's and the total inside and outside SMSA's, the 1950 figures are based on 1960 boundaries; for central cities, however, the figures are based on 1950 city limits for cities designated central cities in 1960. The 1950 figures for the urban and rural portions of a State, division, region, or the United States are based on the 1950 designation of urban and rural territory. The 1950 figures for rural-nonfarm and rural-farm units in table 5 in the State chapters reflect the 1950 definition of farm residence; because of the change in the definition of farm residence, the 1950 and 1960 figures are not comparable. Leaders (—) are shown where it was not possible or feasible to reconstruct the 1950 figures.

The "population per occupied unit" in the 1940 Census of Housing is essentially comparable with the concept of "population per occupied unit" (or "population per household") in the 1950 and 1960 Censuses. Similarly, the concept of population per unit (identified as "population per family" or "population per private family") in the Censuses of Population in 1930 and earlier are essentially comparable with the current concept of population per occupied unit (or household). The population count in the publications of 1940 and some of the earlier censuses, however, is the total population and includes persons in institutions, rooming houses, and similar quarters. Likewise, counts of units (families) for some of the censuses include group quarters or quasi-family groups. Thus, comparability is affected in small areas having an appreciable number of persons in group quarters (quasi-family groups).

In text table F in the United States Summary chapter, total population was used for all years in the computation of the population per occupied unit to provide consistency.

Persons (P2).—All persons enumerated in the 1960 Census of Population as members of the household were counted in determining the number of persons who occupied the housing unit. These persons include not only occupants related to the head but also any lodgers (roomers, boarders, partners, wards, foster children) and resident employees who shared the living quarters of the household head.

The median number of persons for occupied housing units is the theoretical value which divides the distribution into two equal parts—one-half the units having more persons and one-half having fewer persons than the median. In the computation of the median, a continuous distribution was assumed, with the whole number of persons as the midpoint of the class interval. For example, when the median was in the 3-person group, the lower and upper limits were assumed to be 2.5 and 3.5 persons, respectively. In table 26 of the State chapters of Volume I, the median for all occupied units was computed from the 100-percent count of units, whereas the medians for owner- and renter-occupied units were computed from the 25-percent sample of units. The sample rate for medians in other tables is given in table I.

Comparable data on the number of persons in the unit are available from the 1950 and 1940 Censuses of Housing. In certain areas, comparability may be affected to some small extent by the change in concept from dwelling unit to housing unit. Data are available also from the Censuses of Population in 1930 and earlier; however, data for some of these censuses pertain only to persons related to the head.

Persons per room.—The number of persons per room was computed for each occupied housing unit by dividing the number of persons by the number of rooms in the unit. The tabulation form contained a terminal category of "10 or more" rooms; for purposes of the computation, the terminal category was given a mean value of 11. Similar data are available from the 1950 and 1940 Censuses.

Color (P5).—Occupied housing units are classified according to the color of the head of the household into two groups, white and nonwhite. Data for units with nonwhite household heads are published for areas having a specified number of such units (see section on "Description of tables"). The color group designated "nonwhite" consists of such races or ethnic groups as Negro, American Indian, Japanese, Chinese, Filipino, Hawaiian, Eskimo, Aleut, Korean, Asian Indian, and Malayan. Persons of Mexican birth or ancestry who are not definitely of Indian or other nonwhite race are classified as white. Persons of mixed racial parentage are classified as nonwhite.

The concept of race, as it has been used by the Bureau of the Census, is derived from that which is commonly accepted by the general public. The use of self-enumeration in the 1960 Census may have affected the accuracy of the data on color as compared with earlier censuses. Whereas formerly the classification was obtained in most cases by the enumerator's observation, in 1960 it was possible for members of the household to classify themselves.

Data on color of head of household are available from the 1950 and 1940 Censuses of Housing. Except for 1910, the number of units (families) by color of household head is available from the Censuses of Population from 1930 back to 1890 (data for 1910 being available only for the Southern States).

Heads of Spanish surname and Puerto Rican heads.—In order to provide data for housing occupied by Spanish- and Mexican-Americans for areas of the United States where most of these persons live, white household heads of Spanish surname were identified in five Southwestern States (Arizona, California, Colorado, New Mexico, and Texas). In all other States, Puerto Rican heads of households were identified. Puerto Ricans comprise persons born in Puerto Rico and persons of native parentage with at least one parent born in Puerto Rico (as determined by population items on place of birth). Native persons include persons born in the United States, the Commonwealth of Puerto Rico, or a possession of the United States. Data are published in the State chapters for areas having a specified number of units with white household heads of Spanish surname or units with Puerto Rican heads (see section on "Description of tables"). No data for these units are published in the United States Summary chapter.

Housing data were published in 1950, but not in earlier censuses, for units with white household heads of Spanish surname in the five Southwestern States. Housing data for units with Puerto Rican heads are not available in censuses prior to 1960.

Tenure (H12).—A housing unit is "owner occupied" (reported as "owned or being bought" on the enumeration forms) if the owner or co-owner lives in the unit, even if it is mortgaged or not

fully paid for. The owner need not be the head of the household. A cooperative apartment unit is "owner occupied" only if the owner lives in it.

All other occupied units are classified as "renter occupied," including units rented for cash as well as units occupied without payment of cash rent. Units rented for cash (reported on the direct-interview form as "rented") are units for which any money rent is paid or contracted for. Such rent is commonly paid by the occupants but may be paid by persons not living in the unit—for example, a welfare agency. Units for which no cash rent is paid include units provided by relatives not living in the unit and occupied without rental payment, units provided in exchange for services rendered, and units occupied by a tenant farmer or sharecropper who does not pay any cash rent. "No cash rent" appears as a category in the rent tabulations. In county tables for rural-farm units in the State chapters, the category appears under "rent status."

Essentially the same definitions of tenure were used in the 1950 and 1940 Censuses of Housing and in the Censuses of Population from 1930 back to 1890.

Year moved into unit (P12).—Data on year moved into unit are based on the information reported for the head of the household. The question refers to the year of latest move. Thus, if the head moved back into a unit he had previously occupied, the year he moved back was to be reported; or if he moved from one apartment to another in the same building, the year he moved into his present unit was to be reported.

The intent of the question is to establish the year the present occupancy of the unit began, as indicated by the year the household head moved into the unit. The year the head moves is not necessarily the same year other members of the household move, although in the great majority of cases the entire household moves at the same time. The statistics roughly reflect turnover in occupancy of units but do not necessarily indicate the total number of changes in occupancy that have occurred in a given period.

Data on year moved into the unit were not collected in censuses prior to 1960.

Vacant housing unit.—A housing unit is "vacant" if no persons are living in it at the time of enumeration. However, if its occupants are only temporarily absent, the unit is considered occupied. Units temporarily occupied entirely by persons having a usual place of residence elsewhere are classified as vacant (the unit at their usual residence is considered occupied). A vacant unit may be furnished or unfurnished; it may be offered for rent or sale; it may have been rented or sold but the new occupants have not moved in; or it may be held off the market for the owner's occasional or future use, for speculation, or for other reasons.

Newly constructed vacant units are included in the inventory if construction has reached the point that all the exterior windows and doors are installed and the final usable floors are in place. If construction has not reached this point, the unit is excluded. Dilapidated vacant units are included, provided they are still usable as living quarters; they are excluded if they are unfit for human habitation. Vacant units are defined as unfit for human habitation if, through deterioration or vandalism, most of the doors and windows are missing and the floors are unsafe.

Vacant quarters are excluded from the housing inventory if there is positive evidence (a sign, notice, or mark on the house or in the block) that the unit is to be demolished. Vacant quarters condemned for reasons of health or safety so that further occupancy is prohibited are likewise excluded from the inventory. Also excluded are quarters being used for commercial or business purposes, quarters used for the storage of hay, machinery, business supplies, and the like; and vacant trailers.

With few exceptions, the same general instructions were used in 1950. In the 1960 Census, however, the instructions for enumerating certain vacant units were more specific than in 1950, particularly the instructions regarding units to be demolished, units unfit for human habitation, and units being used for non-residential purposes. It is possible also that comparability is affected in some areas by the change from "dwelling unit" to "housing unit."

Information for vacant units was first collected in the 1940 Census of Housing. The counts and categories are not entirely comparable with those in 1960. The 1960 and 1950 counts are considered more inclusive.

Year-round or seasonal occupancy (H7).—Year-round housing units are units which are usually occupied or intended for occupancy at any time of the year. A unit used only occasionally throughout the year is considered a year-round unit. In resort areas, a unit which is usually occupied on a year-round basis is also considered a year-round unit.

Seasonal units are intended for occupancy during only a season of the year. Included are units intended for summer or winter recreational use, such as beach cottages and hunting cabins; units held for herders, loggers, and cannery workers; and units intended for migratory workers employed in farmwork during the crop season. Although units held for migratory workers were separately identified by the enumerator, they were included with other seasonal units in the tabulations.

Essentially the same definitions were used in the 1950 Census. In 1950, however, units which were temporarily occupied by persons having a usual residence elsewhere (classified as "nonresident" units) were shown as a separate category and, although they were treated as vacant units, they were not classified by year-round or seasonal use as in 1960. It is believed that most of the "nonresident" units in 1950 would have been classified as seasonal.

Data for year-round units are presented by condition and vacancy status in most tables. For seasonal units, however, no detail is shown.

Vacancy status (H13).—Status of a vacant unit is reported as of the time of enumeration. In the tabulations, the five categories described below apply to vacant units intended for year-round occupancy and in sound or deteriorating condition.

The count of *available* vacancies constitutes a measure of vacant units on the housing market. It consists of units which are for year-round occupancy, are in either sound or deteriorating condition, and are offered for rent or for sale. Excluded are seasonal units; dilapidated units; and units already rented or sold, held for occasional use, or not on the rental or sale market for other reasons.

The 1960 category "available" is comparable with the 1950 category "nonseasonal not dilapidated, for rent or sale." The separate categories "for sale only" and "for rent" for both years also are comparable since essentially the same concepts were used; in 1950, however, characteristics were not tabulated for the two groups separately, except for value and rent. The categories provided in the 1940 Census reports are not comparable with the 1960 or 1950 categories.

Units *available for sale only* are the available vacant units which are offered for sale only; they exclude units offered "for sale or rent." A vacant unit in a cooperatively owned apartment building is included if the individual unit is "for sale only." A vacant unit in a multiunit structure which is for sale as an entire structure is included if that unit is intended to be occupied by the new owner and if the unit is not also for rent.

Units *available for rent* are the available vacant units which are offered for rent and those offered for rent or sale at the same time.

The category tabulated as *rented or sold, awaiting occupancy* consists of vacant units which are for year-round occupancy and in either sound or deteriorating condition, and which have been rented or sold but the new occupants have not moved in as of the date of enumeration.

The category tabulated as *held for occasional use* consists of vacant units which are for year-round occupancy and in either sound or deteriorating condition, and which are held for weekend or other occasional use. The intent of this question was to identify homes reserved by their owners as "second homes." Because of the difficulty of distinguishing between this category and seasonal vacancies, however, it is possible that some second homes were classified as seasonal and therefore are included in the category "seasonal."

The category tabulated as *held for other reasons* consists of vacant units which are for year-round occupancy and in either sound or deteriorating condition, and which are held off the market for reasons not specified above. For example, the category includes units held for a caretaker or janitor, units held for settlement of an estate, and units held for personal reasons of the owner.

The categories "rented or sold, awaiting occupancy," "held for occasional use," and "held for other reasons" when combined are comparable with the 1950 category "nonseasonal not dilapidated, not for rent or sale" (and some portion of the 1950 "nonresident" category).

Homeowner vacancy rate.—The percentage relationship between vacant units available for sale and the total homeowner inventory is termed the homeowner vacancy rate. The total homeowner inventory consists of owner-occupied units and vacant units available for sale. This rate more adequately describes the sale market than a rate based on total housing units.

Rental vacancy rate.—The percentage relationship between vacant units available for rent and the total rental inventory is termed the rental vacancy rate. The total rental inventory consists of renter-occupied units and vacant units available for rent. This rate more adequately describes rental market conditions than a rate based on total housing units.

Duration of vacancy (H38).—The duration of vacancy is the length of time (in months) from the date the last occupants moved from the unit to the date of enumeration. The data, therefore, do not provide a direct measure of the total length of time units remain vacant. For newly constructed units which have never been occupied, the duration of vacancy represents the time period since the date construction was completed.

No information on duration of vacancy was collected in previous censuses.

Acres in the place (H17).—In the State chapters of Volume I, data on number of acres in the place are presented for vacant units in rural territory. The categories are "10 acres or more" and "less than 10 acres" (see section on "Farm-nonfarm residence").

Comparability with the Housing Vacancy Survey.—Data on many of the vacancy characteristics in Volume I are available for the United States (by inside and outside standard metropolitan statistical areas) from the Housing Vacancy Survey (HVS). This nationwide survey, covering a sample of approximately 42,000 units (occupied and vacant) is conducted monthly by the Bureau of the Census in conjunction with its Current Population Survey. Data are published quarterly in *Current Housing Reports*, Series H-111, *Housing Vacancies*. The concepts and definitions used in the HVS in 1960 were essentially the same as those used in the April 1960 Census.

Results showed that 9.1 percent of the total housing units in the United States were vacant according to the April 1960 Census and 10.2 percent were vacant according to the HVS for the first quarter 1960. These vacant units include units available for sale or rent, seasonal units, dilapidated units, and other types that are held off the market. Vacant units available for sale amounted to 0.9 percent of the total housing inventory in the April 1960 Census and 0.6 percent in the HVS; the rates for vacant units available for rent were 2.5 and 2.6 percent, respectively. Characteristics of available vacancies, such as median sale price, median rent, median number of rooms, and the proportion with all plumbing facilities agreed fairly closely.

Differences between the April 1960 Census and the HVS may be attributed to several factors. Sampling variability of the figures from the HVS and those based on a sample from the April 1960 Census is one factor. Other factors include survey techniques; methods used in weighting the sample estimates; the more extensive training, control, and experience of the HVS enumerators than of the census enumerators; and the use of hourly rate payments in the HVS and of piece-rate payments in the census.

Farm-nonfarm residence (H17, H18, H42).—In rural territory, occupied housing units are subdivided into rural-farm and rural-nonfarm units on the basis of number of acres in the place and total sales of farm products in 1959. All vacant units are included in the rural-nonfarm inventory. Number of acres in the place was reported for vacant units but no information was obtained on sales of farm products.

Occupied housing units are classified as farm units if they are located on places of 10 or more acres from which sales of farm products amounted to \$50 or more in 1959, or on places of less than 10 acres from which sales of farm products amounted to \$250 or more in 1959. The remaining occupied units, including those on "city lots," are classified as nonfarm units. (A house is on a city lot if it is located in a community or closely built-up area and the "place" is no larger than the house and yard.) Oc-

occupied units for which cash rent is paid also are classified as nonfarm if the rent does not include any land used for farming, even though the place on which the unit is located qualifies as a farm.

For purposes of determining farm residence, the residential "place" consists of the land which the respondent considers to be the farm, ranch, or property. The place may consist of more than one tract of land; the tracts are usually adjoining although they may be separated by a road, creek, or another piece of land. If there is more than one house on the place, all have the same farm-nonfarm classification (except that, on farms, units for which cash rent is paid are always classified as nonfarm if the rent does not include any land used for farming). For example, if the operator lives in one house and a hired hand lives in a separate house on the same place, both housing units have the same classification.

Sales of farm products refer to the total amount (gross amount) received from the sale of crops, vegetables, fruits, nuts, livestock and livestock products (milk, wool, etc.), poultry and poultry products, and nursery and forest products produced on the place and sold at any time during 1959.

Farm-nonfarm residence in 1950 was determined for both occupied and vacant units in rural territory by the respondent's answer to the question, "Is this house on a farm or ranch?" Units on farms whose occupants paid cash rent for the house and yard only were classified as nonfarm, similar to the procedure in 1960. Units on institutional grounds and in summer camps and tourist courts were classified as nonfarm in 1950, regardless of the answer to the above question. Housing units in such places in 1960 are classified according to the answers to the questions on acreage and sales of products.

Farm residence was determined in the 1940 Census of Housing also. Counts of farm units (families) are available for each of the census years from 1930 back to 1890. Comparability is affected not only by the change in the definition of farm residence but also by the change in the delineation of urban and rural territory.

In 1950 and 1940, a count of farm dwelling units located in cities and other urban territory was obtained, but in the 1960 Census of Housing no effort was made to identify urban-farm units. In 1950, the count of urban-farm units (occupied and vacant) amounted to only about 96,000 in the United States as a whole.

The definition of farm residence adopted for 1960 employs more restrictive criteria than the 1950 definition. One reason for the change was to make the definition of farm residence essentially consistent with the definition of a farm used in the agricultural census, beginning with the 1959 Census of Agriculture. The effect of the 1960 definition is to exclude from the farm inventory, those housing units located on places considered as farms by the occupants but from which agricultural products are not sold or from which sales are below the specified minimum. On the other hand, the 1960 definition brings into the farm inventory a smaller group of housing units which meet the criteria but which are not considered by the occupants to be located on farms.

A test conducted in the Census Bureau's Current Population Survey (CPS) in March 1960 indicated that at that time the change in definition of farm residence resulted in a net reduction of 1.0 million occupied units (households) on farms, representing approximately one-fifth of the farm units under the 1950 definition. The CPS estimate of 4.1 million occupied farm units under the new definition, however, was 0.5 million greater than the April 1960 Census figure of 3.6 million. No similar estimates of the difference are available by State or smaller area. The impact of the change in definition has probably been very uneven from one area to another.

Although there is no conclusive evidence on the relative validity of the farm-nonfarm classification in the CPS as compared with

that in the April 1960 Census, several factors must be taken into consideration in evaluating the figure, 0.5 million. These factors include the more extensive training, control, and experience of the CPS enumerators than of the census enumerators; the use of hourly rate payments in the CPS and of piece-rate payments in the census; the use of self-enumeration in the census; the methods used in weighting the sample estimates; and the difference between the sampling variability in the CPS and in the 25-percent sample in the 1960 Census. There is also a difference between the definition of urban territory in the census and that in the CPS. In the March 1960 CPS, the boundaries of urban areas used were still those of the 1950 Census of Housing and did not include the annexations and other substantial expansions of urban territory that were incorporated in the 1960 Census of Housing. In the 1960 Census, the determination of farm residence was limited to rural territory as defined in 1960. The effect of this difference was to classify an unknown but presumably small number of units as rural farm in the CPS that are treated as urban in the reports of the 1960 Census. Finally, for some of the units in the CPS sample in March 1960, the determination as to farm residence had been made as early as December 1959, whereas the determination for the units in the April 1960 Census was made as of the time of enumeration. In view of the continued decline in the number of farms, it is probable that a number of places that qualified as farms in December would no longer have been so classified in April.

There are differences also between the number of farms as enumerated in the 1959 Census of Agriculture and the number of occupied rural-farm housing units from the 1960 Census of Housing. According to the 1959 Census of Agriculture, there were 3.7 million farms in the United States and 3.4 million farm operators living on the farms they operated. The number of occupied rural-farm housing units according to the 1960 Census of Housing (3.6 million) was 3.8 percent below the number of farms but 3.6 percent above the number of resident farm operators. Even if there had been no errors of enumeration, the number of occupied rural-farm housing units from the Census of Housing would not equal exactly either the number of farms or the number of operators living on the farms they operated. The Census of Agriculture, for example, includes farms in urban territory. Moreover, there are two or more occupied housing units on some farms and no occupied housing units on other farms. In addition, there may be occupied farm housing units even where there is no resident farm operator. Finally, the Census of Agriculture was taken in the fall of 1959, and evidence from other sources suggests that there was some decline in the number of farm units between the time of the Census of Agriculture and the Census of Housing.

Data from a study in which schedules from the 1960 Sample Survey of Agriculture were matched with those from the 1960 Census of Housing suggest that approximately 13 percent of the units occupied by farm operators in rural areas were not classified as farm units in the 1960 Census of Housing. The nature of the matching procedure was such that it was not possible to identify and count the complementary group of units classified as farm in the housing census but as nonfarm in the agriculture survey.

STRUCTURAL CHARACTERISTICS

The comparison of the wording and explanations that appeared on the self-enumeration and direct-interview forms is given below. Type of housing unit and number of units in structure were always to be determined by the enumerator through observation and supplementary questions asked of the respondent. Number of rooms appeared as a self-enumeration item on the Advance Census Report, and all the other self-enumeration items appeared on the Household Questionnaire, which was used in two-stage areas. The direct-interview questions appeared on a FOSDIC schedule. Although the question on year built appeared on the self-enumeration form, the enumerator was instructed to obtain

this information from the resident owner, manager, or janitor if the unit was in a structure containing five housing units or more.

Rooms (H8).—The number of rooms in the unit is the count of whole rooms used for living purposes, such as living rooms, dining rooms, bedrooms, kitchens, finished attic or basement rooms, recreation rooms, lodgers' rooms, and rooms used for offices by a person living in the unit. Not considered as rooms are bathrooms; halls, foyers, or vestibules; closets; alcoves; pantries; strip or pullman kitchens; laundry or furnace rooms; unfinished attics, basements, and other space used for storage; porches, unless they are permanently enclosed and suitable for year-round

use; and offices used only by persons not living in the unit. A partially divided room, such as a dinette next to a kitchen or living room, is considered a separate room if there is a partition from floor to ceiling. Rooms equipped with movable partitions from floor to ceiling are separate rooms. If a room is shared by occupants of more than one unit, it is included with the unit from which it is most easily reached.

The median number of rooms is the theoretical value which divides the distribution of units into two equal parts—one-half the units having more rooms and one-half having fewer rooms than the median. In the computation of the median, a continuous distribution was assumed, with the whole number of rooms as the midpoint of the class interval. For example, when the median was in the 5-room group, the lower and upper limits were assumed to be 4.5 and 5.5 rooms, respectively. A plus (+) sign after a median indicates that the median falls in the terminal category; for example, "7.5+" indicates that the median falls in the category "8 rooms or more" and was not computed. Because the terminal category for some of the tabulations was higher than "8 rooms or more," a median above 7.5 is not necessarily higher than a median of "7.5+" rooms. In table 25 of the State chapters, the median for all units was computed from the 100-percent count of units, whereas the medians for owner- and renter-occupied units were computed for a sample of units. The sample rate for medians in other tables is given in table I.

Average number of rooms (arithmetic mean) is provided for places of 1,000 to 2,500 inhabitants in the State chapters. It was computed by dividing the sum of the rooms for each tenure group by the number of owner- or renter-occupied units, respectively. The tabulation form contained a terminal category of "10 or more" rooms. For purposes of the computation, the terminal category was given a mean value of 11.

The 1960 data on number of rooms are considered directly comparable with 1950 and 1940 data, since essentially the same definitions were used in all three censuses. In certain areas, comparability between 1950 and 1960 may be affected to some small extent by the change in concept from dwelling unit to housing unit.

Bedrooms (H19).—The number of bedrooms in the unit is the count of rooms used mainly as bedrooms. In addition to regular bedrooms, the count includes studies, dens, enclosed porches, finished attics, guest rooms, or other extra rooms if they are currently used principally and regularly for sleeping. Rooms used only occasionally for sleeping, such as a living room with a hide-away bed, were not to be counted as bedrooms. A housing unit consisting of only one room, such as a 1-room efficiency apartment, was to be reported as having no bedroom.

Information on the number of bedrooms was not collected in the 1950 or 1940 Censuses.

Year structure built (H20).—"Year built" refers to the date the original construction of the structure was completed, not to any later remodeling, addition, or conversion. For trailers, the model year was assumed to be the year built.

The figures on the number of units built during a given period relate to the number of units in existence at the time of enumeration. The figures reflect the number of units constructed during a given period plus the number created by conversions in structures originally built during that period, minus the number lost in structures built during the period. Losses occur through demolition, fire, flood, disaster; change to nonresidential use; or merger to fewer housing units.

Data on year built are more susceptible to errors of response and nonreporting than data on many of the other items. In most cases, the information was given according to memory or estimates of the occupants of the structure or of other persons who had lived in the neighborhood a long time.

Statistics in this volume on the number of new units, according to the data on year built, may differ from figures on new construction collected in the Components of Inventory Change program which employed specialized procedures for collecting the data. (Statistics on new construction units for selected SMSA's, the four regions, and the United States are published in 1960 *Census of Housing*, Volume IV, *Components of Inventory Change*, Parts 1A and 1B.)

Data on year built were collected in the 1950 and the 1940 Censuses of Housing also. While the definitions were the same in the three censuses, comparability of the data may be affected by relatively large reporting errors.

Units in structure (H29).—In determining the number of units in the structure, the enumerator was instructed to count both occupied and vacant housing units, but not business units or group quarters. A structure is defined as a separate building that either has open space on all four sides, or is separated from other structures by dividing walls that extend from ground to roof. Structures containing only one housing unit were further classified as detached or attached. Trailers are tabulated as units in 1-unit detached structures when not shown as a separate category in a table.

A 1-unit detached structure has open space on all four sides and contains only one housing unit. Such a structure is considered detached even though it has an adjoining shed or private garage or contains a business unit. A 1-unit attached structure contains only one housing unit and has one or more walls extending from ground to roof separating it from adjoining structures. For row houses, double houses, or houses attached to nonresidential structures, each house is a separate attached structure if the dividing or common wall goes from ground to roof.

Statistics are presented in terms of number of housing units rather than number of residential structures. The number of structures for some of the categories, however, is apparent. For housing units in 1-unit structures, the number of housing units and the number of structures are the same. The number of housing units in 2-unit structures is twice the number of structures. For the remaining categories, the number of structures cannot be ascertained from the data as tabulated.

Some of the categories for number of housing units in structure in 1960 are not directly comparable with those in 1950—in particular the categories for 1- and 2-unit structures. In 1950, units in detached or attached structures were shown separately, but those in semidetached structures containing 1 or 2 units were combined into one category. ("Semidetached" structures of 1950 are defined as "attached" in 1960.) Comparability between 1950 and 1960 data may also be affected by the change in concept from dwelling unit to housing unit.

In the 1940 Census, data were provided on number of residential structures as well as number of units in a structure. The 1940 definitions were basically the same as in 1960 with a few exceptions. Principally, each unit classified as "2-family side-by-side" in 1940 would be classified as "1-unit attached" according to the 1960 definition; and units in structures containing a business and having one to four units constituted a separate category in 1940.

Statistics on the count of structures and number of persons per structure are available from the Censuses of Population from 1890 to 1930. In those censuses, data were shown in terms of "dwellings," the concept of "dwelling" being roughly comparable with the current concept of "structure." Statistics on the number of occupied units per structure (families per dwelling) also were included in some of the censuses.

Trailer (H3, H37).—Trailers are included in the housing inventory if they are occupied as living quarters; vacant trailers and trailers used only for business or vacation purposes were not enumerated. When one or more rooms have been added to a

trailer, however, it is classified as "house, apartment, flat." A trailer is "mobile" if it rests on wheels or on a temporary foundation, such as blocks or posts. A trailer is "on a permanent foundation" if it is mounted on a regular foundation of brick, stone, concrete, etc. Characteristics of occupied trailers are included in all the tabulations except those on value. Trailers are shown as a separate category, for some areas, in the tabulations on number of units in structure.

In 1950, only occupied trailers on wheels or on temporary foundations were identified. A trailer on a permanent foundation or with a room added was classified as "house, apartment, flat." In 1940, occupied trailers were combined with tents, boats, railroad cars, and shacks in the published data.

Basement (H33).—Statistics on basements are presented in terms of the number of housing units located in structures built with a basement, on a concrete slab, or in another way. "Basement" is defined as enclosed space beneath all or part of a structure, accessible to the occupants and of sufficient depth so that an adult can walk upright. Units built on a "concrete slab" have no basement and no crawl space or air space below the first floor. The category "other" includes units in structures resting on posts, those built directly on the ground, and those having only crawl space under the building to provide ventilation or accessibility for service or repairs.

No question about basements was asked in censuses prior to 1960.

Elevator in structure (H34).—Statistics on elevator in structure are presented in terms of the number of housing units located in structures with four stories or more, not counting the basement. Units are classified "with elevator" if they are located in a building with an elevator which passengers may use. Units are in a "walkup" structure if the structure has no passenger elevator or if the only elevator service is for freight. Data on elevators are published only for large places, that is, places which had a population of 50,000 or more in 1950 or in an interim census prior to 1960 and also had a population of 50,000 or more in 1960. Data for all such places in the United States are given in the United States Summary chapter. No data on elevator in structure are given in the State chapters.

Data on elevator in structure were not collected in earlier censuses.

CONDITION AND PLUMBING FACILITIES

The questions on condition and plumbing are shown below. Water supply, toilet facilities, and bathing facilities appeared as self-enumeration items on the Advance Census Report and the remaining three self-enumeration items appeared on the Household Questionnaire, which was used in two-stage areas. The direct-interview questions appeared on a FOSDIC schedule. Condition of the unit, however, was determined by the enumerator on the basis of his observation; the respondent was not to be questioned about the condition of his living quarters.

Condition and plumbing combined.—Both the condition of a housing unit and the type of plumbing facilities are considered measures of the quality of housing. Categories representing various levels of housing quality have been established by presenting the items in combination.

To measure condition, the enumerator classified each housing unit in one of three categories: Sound, deteriorating, or dilapidated. The plumbing facilities that are combined with condition are: Water supply, toilet facilities, and bathing facilities.

The category "with all plumbing facilities" consists of units which have piped hot and cold water inside the structure, and flush toilet and bathtub (or shower) inside the structure for the exclusive use of the occupants of the unit.

H32. Is the house connected to a public sewer?

Public sewer..... ☐
 Septic tank or cesspool..... ☐
 Other..... ☐

Units "lacking only hot water" have all the facilities except piped hot water. Units "lacking other plumbing facilities" may (or may not) have hot water but lack one or more of the other specified facilities. Also included in this category are units having no piped water inside the structure and units whose occupants share toilet or bathing facilities with the occupants of another housing unit. The combination of "lacking only hot water" and "lacking other plumbing facilities" is presented as "lacking some or all facilities" in some of the distributions.

In the distribution of plumbing facilities for vacant available units, the figures apply only to sound and deteriorating units.

Data for dilapidated vacant units are not shown separately, but are included in the distribution for "all units."

Condition was presented in combination with plumbing facilities in the 1950 reports also. If the respective categories under "sound" and "deteriorating" are combined, the 1960 category "with all plumbing facilities" compares with the 1950 "not dilapidated, with private toilet and bath, and hot running water"; the 1960 "lacking only hot water" compares with the 1950 "not dilapidated, with private toilet and bath, and only cold water"; and the 1960 "lacking other plumbing facilities" compares with the 1950 combination of "not dilapidated, with running water, lacking private toilet or bath" and "not dilapidated, no running water."

Condition (H6).—The enumerator determined the condition of the housing unit by observation, on the basis of specified criteria related to the extent or degree of visible defects. The types of defects the enumerator was to look for are associated with weather tightness, extent of disrepair, hazards to the physical safety of the occupants, and inadequate or makeshift construction. These are signs of other structural defects which may be hidden. Defects which would be revealed only by a more careful inspection than is possible during a census, such as the presence of dampness or infestation, inadequate wiring, and rotted beams, are not included in the criteria for determining the condition of a unit.

Sound housing is defined as that which has no defects, or only slight defects which normally are corrected during the course of regular maintenance. Examples of slight defects are: Lack of paint; slight damage to porch or steps; slight wearing away of mortar between bricks or other masonry; small cracks in walls, plaster or chimney; cracked windows; slight wear on floors, doorsills, doorframes, window sills, or window frames; and broken gutters or downspouts.

Deteriorating housing needs more repair than would be provided in the course of regular maintenance. Such housing has one or more defects of an intermediate nature that must be corrected if the unit is to continue to provide safe and adequate shelter. Examples of intermediate defects are: Holes, open cracks, rotted, loose, or missing material over a small area of the foundation, walls, roof, floors, or ceilings; shaky or unsafe porch, steps, or railings; several broken or missing windowpanes; some rotted or loose window frames or sashes that are no longer rain-proof or windproof; broken or loose stair treads, or broken, loose, or missing risers, balusters, or railings of inside or outside stairs; deep wear on doorsills, doorframes, outside or inside steps or floors; missing bricks or cracks in the chimney which are not serious enough to be a fire hazard; and makeshift chimney such as a stovepipe or other uninsulated pipe leading directly from the stove to the outside through a hole in the roof, wall, or window. Such defects are signs of neglect which lead to serious structural deterioration or damage if not corrected.

Dilapidated housing does not provide safe and adequate shelter and in its present condition endangers the health, safety, or well-being of the occupants. Such housing has one or more critical defects; or has a combination of intermediate defects in sufficient number or extent to require considerable repair or rebuilding; or is of inadequate original construction. The defects are either so critical or so widespread that the structure should be extensively repaired, rebuilt, or torn down.

Critical defects result from continued neglect or lack of repair, or indicate serious damage to the structure. Examples of critical defects are: Holes, open cracks, or rotted, loose, or missing material (clapboard siding, shingles, bricks, concrete, tile, plaster, or floorboards) over a large area of the foundation, outside walls, roof, chimney, or inside walls, floors, or ceilings; substantial sagging of floors, walls, or roof; and extensive damage by storm, fire, or flood.

To be classified as dilapidated on the basis of intermediate defects, a housing unit must have such defects in sufficient number or extent that it no longer provides safe and adequate shelter. No set number of intermediate defects is required.

Inadequate original construction includes: Shacks, huts, or tents; structures with makeshift walls or roofs, or built of packing boxes, scrap lumber, or tin; structures lacking foundations (walls rest directly on the ground); structures with dirt floors; and cellars, sheds, barns, garages, or other places not originally intended for living quarters and inadequately converted to such use.

The enumerator was instructed to judge each unit on the basis of its own characteristics, regardless of the neighborhood, age of the structure, or the race or color of the occupants. He was cautioned, for example, that although lack of paint is only a slight defect, this and other signs of neglect are warnings to look closely for more serious defects. Also, exterior covering may improve the appearance of a structure but not its condition, and the sturdiness of brick or other masonry walls can be misleading if there are defects in other parts of the structure.

In judging condition, the enumerator was instructed to determine whether the unit was dilapidated or not dilapidated. If the unit was "not dilapidated," then he was to classify it as "sound" or "deteriorating." The use of this technique in 1960 was designed to maintain comparability with the 1950 enumeration of condition when only the two categories, not dilapidated and dilapidated, were reported. The change to the three-way classification of condition in 1960 reflects the growing interest in housing quality and its importance in slum clearance and urban renewal programs.

The new classification and improved training techniques, designed to yield more adequate measures of potential urban blight, were developed by a group of experts working with the census staff. Field studies were conducted to explore the feasibility of the three-way classification and to test various types of training instructions that would define and convey to enumerators the concepts of the three levels of condition. While the 1950 concept and definition of the category "dilapidated" were retained without change for 1960, additional study was required to develop the concepts and terminology for the two other categories.

The enumerator was provided with detailed written instructions and with photographs illustrating the levels of condition. In addition, audio-visual techniques were used in training the enumerator. A filmstrip of photographs in color depicted various types of defects and a recorded narrative explained how to determine the classification of condition on the basis of these defects. Photographs and instructions from the Enumerator's Reference Manuals are reproduced in the appendix to the United States Summary chapter of Volume I.

Although detailed oral and written instructions and visual aids were provided, it was not possible to achieve uniform results in applying the criteria for determining the condition of a unit. Data on condition for small areas, which depend on the work of only a few enumerators, may have a wider margin of relative error than data for larger areas, which are based on the work of a number of enumerators.

The 1960 and 1950 definitions of "dilapidated" are considered comparable, since the basic 1950 concept of dilapidation was retained in 1960. The 1960 concepts of "sound" and "deteriorating" combined are comparable with the 1950 concept "not dilapidated." It is possible, however, that the change in categories introduced an element of difference between the 1960 and 1950 statistics.

The concept of "dilapidation" replaced the concept of "needing major repairs" which was used in the 1940 Census. Because the two terms differ significantly, the 1940 results are not comparable with the 1950 or 1960 results on condition.

Water supply (H9).—A housing unit is classified in the tables as having "piped water inside structure" if there is running water inside the structure and it is available to the occupants of the unit. A unit has piped hot water even though the hot water is not supplied continuously; for example, it may be supplied only at certain times of the day, week, or year. Units with "piped water outside structure" have no running water inside the structure but have running water available on the same property, either outdoors or in another structure. In the category "no piped water" are units for which the only source of water is a hand pump, open well, spring, cistern, etc., and units in which the occupants obtain water from a source which is not on the same property.

The 1950 Census data on water supply are comparable with the 1960 data. The 1940 Census data, however, were presented on the basis of the availability of piped water inside or outside the unit rather than inside or outside the structure. The 1960 count of units with piped water inside the structure may be considered roughly comparable with the 1940 count of units with running water in the unit, except where there is an appreciable number of units with running water inside the structure but outside the unit.

Toilet facilities (H10).—A housing unit has a flush toilet (supplied with piped water) if it is inside the structure and available for the use of the occupants of the unit. Flush toilets for ex-

clusive use are differentiated from those that are shared with occupants of other units. Units with other toilet facilities, such as privy, chemical toilet, or outside flush toilet, and units with no toilet facilities are included in the category "other toilet facilities or none" (reported "none" or "no flush toilet for the use of this household" on the enumeration forms).

Data comparable with the 1960 data were provided by both the 1950 and 1940 Censuses.

Bathing facilities (H11).—A housing unit has a bathtub or shower if either facility, supplied with piped water (not necessarily hot water), is inside the structure and available for the use of the occupants of the unit. Bathing facilities for exclusive use are differentiated from those that are shared with occupants of other units. The category "no bathtub or shower" (reported "none" or "no bathtub or shower for the use of this household" on the enumeration forms) consists of units with only portable facilities, as well as units having no bathing facilities inside the structure and available for the use of the occupants.

Data comparable with the 1960 data were provided by both the 1950 and 1940 Censuses.

Exclusive or shared use.—Facilities are "for exclusive use" if they are used only by the occupants of the one housing unit, including lodgers or other unrelated persons living in the housing unit.

Facilities are "shared" if they are used by occupants of two or more housing units, or if they would be shared with the occupants of a unit now vacant. Shared facilities may be inside one of the units in the structure or may be centrally located where they can be reached by occupants of all units that share them.

Inside or outside structure.—Facilities are located "inside the structure" if they are located inside the same structure as the housing unit. They may be located within the housing unit itself, or they may be located in a hallway or in a room used by occupants of several units. It may even be necessary to go outdoors to reach that part of the structure in which the facilities are located. Facilities located in the basement or on an enclosed porch, or enclosed by partitions on an otherwise open porch, are "inside the structure." Facilities on an open porch (for example, piped water) are "outside the structure."

Bathroom (H30).—A housing unit has a complete bathroom if it has a flush toilet and bathtub (or shower) for the exclusive use of the occupants of the unit and also has piped hot water. (The requirement that the unit must have hot water was imposed during the processing of the data in an edit combining the items on bathroom and water supply.) The facilities must be located inside the structure but need not be in the same room. A partial bathroom consists of toilet or bathing facilities for exclusive use, but not both. Units with a partial bathroom in addition to a complete bathroom are published in the category "1 plus partial" in some tables and "more than 1" in other tables. Units with only a partial bathroom are included in the published category "shared or none" together with units which share or lack bathroom facilities.

No data on number of bathrooms were provided in the 1950 or 1940 Censuses; however, data were presented on the number of units with both private flush toilet and bathtub (or shower).

Source of water (H31).—Data on source of water are published only in the State chapters. The source of water was to be reported in one of three categories. "Public system or private company" refers to a common source supplying running water to more than five houses. The source may be a city or county water department, a water district, a private water company, or a cooperative or partnership group. "Individual well" describes a source which serves five or fewer houses from a well on the property of the unit being enumerated or on a neighboring property. The water from such a well may be hand drawn, wind drawn, or power drawn. It may be piped or not piped; it may be stored in tanks or used directly from the well. (Because the criterion of "five or fewer" houses did not appear on the self-enumeration form, it is possible that some units were reported in the category "individual well" although the well serves more than five houses.) "Other" describes water coming directly from springs, creeks, rivers, ponds, lakes, and all other sources.

Information on source of water was not collected in the larger urban places, that is, places which had a population of 50,000 or more in 1950 or in an interim census prior to 1960. Hence, the county data on source of water in table 35 of the State chapters do not cover units in such places.

No data on source of water were collected in previous censuses.

Sewage disposal (H32).—Data on sewage disposal are published only in the State chapters. This item refers to the sewage disposal system for the structure in which the unit is located. The category "public sewer" applies to units connected to a city, county, sanitary district, neighborhood, or subdivision sewer system. A "septic tank or cesspool" is an underground tank or pit for sewage disposal. Small sewage treatment plants which in some localities are called neighborhood septic tanks are classified as public sewers. Units for which sewage is disposed of in some other way are included in the category shown in the tables as "other or none."

Information on sewage disposal was not collected in the larger urban places, that is, places which had a population of 50,000 or more in 1950 or in an interim census prior to 1960. Hence, the county data on sewage disposal in table 35 of the State chapters do not cover units in such places.

No data on sewage disposal were collected in previous censuses.

EQUIPMENT AND FUELS

Data on equipment and fuels were derived from answers to the questions listed below. The self-enumeration questions appeared on the Household Questionnaire, which was used in two-stage areas. The direct-interview questions appeared on a FOSDIC schedule. Although the questions appeared on the self-enumeration form, the enumerator was instructed to obtain information on heating equipment, house heating fuel, and water heating fuel from the resident owner, manager, or janitor if the unit being enumerated was in a structure containing five housing units or more.

Equipment.—Data on equipment are provided for occupied housing units only, except for heating equipment which was to be reported for all housing units. The statistics are in terms of the number of housing units with the particular equipment or having the equipment available, as the case may be.

Heating equipment (H21).—"Steam or hot water" refers to a central heating system in which heat from steam or hot water is delivered through radiators or other outlets. "Warm air furnace" refers to a central system which provides warm air through ducts leading to the various rooms.

"Floor, wall, or pipeless furnace" includes permanently installed heating units which deliver warm air to the room directly above the furnace or to the room (or rooms) on one or both sides of the wall in which the furnace is installed. These devices do not have ducts leading to other rooms.

"Built-in electric units" are heating units which are permanently installed in floors, walls, or ceilings. Heat pumps are included in this category. In some tables in the State chapters, housing units having a "floor, wall, or pipeless furnace" and those having "built-in electric units" are combined into the one category "built-in room units."

"Other means with flue" (shown on the self-enumeration form as "room heater connected to chimney or flue") describes stoves, radiant gas heaters, fireplaces, and other equipment connected to a chimney or flue which carries off the smoke or fumes. "Other means without flue" (shown on the self-enumeration form as "room heater not connected to chimney or flue") describes electric heaters, electric steam radiators, kerosene heaters, radiant gas heaters, and other portable or plug-in devices not connected to a chimney or flue.

The main type of heating equipment was to be reported even if it was temporarily out of order at the time of enumeration. If two types of heating equipment were used to about the same extent, the type appearing first in the sequence above was to be reported. For vacant units from which the heating equipment had been removed, the equipment used by the last occupants was to be reported.

Similar data on heating equipment were collected in the 1950 Census, except that the 1950 data were restricted to occupied units (1960 data are for all units). Furthermore, the 1960 categories "warm air furnace" and "floor, wall, or pipeless furnace" must be combined to be comparable with the single 1950 category "warm air furnace"; and the 1960 categories "built-in electric units" and "other means without flue" must be combined to be comparable with the single 1950 category "other means without flue."

Data on heating equipment were collected for occupied units in the 1940 Census also. The categories are comparable with 1960 categories when certain combinations are made.

Clothes washing machine (H23).—"Wringer or spinner" describes a power-operated machine which requires handling of the laundry between washing and rinsing. "Automatic or semiautomatic" describes a machine that washes, rinses, and damp dries but does not fully dry the laundry in the same tub. A "washer-dryer combination" is a machine which washes and fully dries the laundry in the same tub.

A clothes washing machine owned by a member of the household was to be reported, whether it was located in the housing unit or elsewhere on the property. Machines used but not owned by members of the household, such as those provided by the management of an apartment building, were not to be reported.

The 1960 Census is the first census to provide information on clothes washing machines.

Clothes dryer (H24).—A clothes dryer is defined as a separate mechanical appliance in which clothes are dried by heated air. Two types are identified—those which operate exclusively with electricity and those which use gas heat for drying. Units with a "washer-dryer combination" are classified as units having no clothes dryer since the dryer is not a separate appliance.

HEATING EQUIPMENT

Self-enumeration

H21. How is your house or apartment heated?
Check *ONLY* the kind of heat you use the most.

Heated by—
Steam or hot water..... ☐
Warm air furnace with individual room registers..... ☐
Floor, wall, or pipeless furnace..... ☐
Built-in electric units..... ☐
Room heater(s) connected to chimney or flue..... ☐
Room heater(s) not connected to chimney or flue..... ☐
Other method (Write in.....)..... ☐
Not heated..... ☐

Direct interview

H21. How is this unit heated?

Steam or hot water..... ☐
Warm air furnace..... ☐
Floor, wall, or pipeless furnace..... ☐
Built-in electric units..... ☐
Other means—with flue..... ☐
Other means—no flue..... ☐
Not heated..... ☐

CLOTHES WASHING MACHINE, CLOTHES DRYER, HOME FOOD FREEZER

Self-enumeration

H23. Do you have a clothes washing machine?
Do not count machines shared with any other household in this building.

Machine with wringer or separate spinner..... ☐
Automatic or semiautomatic machine..... ☐
Washer-dryer combination (single unit)..... ☐
No washing machine..... ☐

H24. Do you have an electric or gas clothes dryer?

Do not count dryers shared with any other household in this building.
Electrically heated dryer..... ☐
Gas heated dryer..... ☐
No dryer..... ☐

H28. Do you have a home food freezer which is separate from your refrigerator?

Yes..... ☐
No..... ☐

Direct interview

H23. Is there a clothes washing machine in this unit?

Wringer or spinner..... ☐
Automatic or semiautomatic..... ☐
Washer-dryer combination..... ☐
No washing machine..... ☐

H24. Is there a clothes dryer in this unit?

Electric..... ☐
Gas..... ☐
No clothes dryer..... ☐

H28. Is there a home food freezer separate from the refrigerator in this unit?

Yes..... ☐
No..... ☐

TELEPHONE AVAILABLE, AUTOMOBILES AVAILABLE

Self-enumeration

H35. Is there a telephone on which people who live here can be called?

Yes..... ☐
No..... ☐

H36. How many passenger automobiles are owned or regularly used by people who live here?

Count company cars kept at home.
No automobile..... ☐
1 automobile..... ☐
2 automobiles..... ☐
3 automobiles or more..... ☐

Direct interview

H35. Is there a telephone on which people in this unit can be called?

Yes..... ☐
No..... ☐

H36. How many automobiles are owned or regularly used by people who live in this unit?

Include company cars kept at home.
No auto..... ☐
1..... ☐
2..... ☐
3 or more..... ☐

AIR CONDITIONING, TELEVISION SETS, RADIO SETS

Self-enumeration

H27. Do you have any air conditioning?

Count only equipment which cools the air by refrigeration.

Room unit—1 only..... ☐
Room units—2 or more..... ☐
Central air conditioning system..... ☐
No air conditioning..... ☐

H25. Do you have any television sets?

Count only sets in working order. Count floor, table, and portable television sets as well as combinations.

1 set..... ☐
2 sets or more..... ☐
No television sets..... ☐

H26. Do you have any radios?

Count only sets in working order. Count floor, table, and portable radios as well as radio combinations. Do not count automobile radios.

1 radio..... ☐
2 radios or more..... ☐
No radios..... ☐

Direct interview

H27. Is there any air conditioning in this unit?

Room units: 1..... ☐
2 or more..... ☐
Central system..... ☐
No air conditioning..... ☐

H25. Is there television in this unit?

1 set..... ☐
2 or more..... ☐
No television..... ☐

H26. Are there any radios in this unit?

1 set..... ☐
2 or more..... ☐
No radios..... ☐

HEATING FUEL, COOKING FUEL, WATER HEATING FUEL

Self-enumeration

H22. Here is a list of fuels.

In the first column, check which one is used most for heating. In the second column, check the one used most for cooking. In the third column, check the fuel used most for heating water.

	House heating fuel	Cooking fuel	Water heating fuel
Coal or coke.....	☐	☐	☐
Wood.....	☐	☐	☐
Utility gas from underground pipes serving the neighborhood.....	☐	☐	☐
Bottled, tank, or LP gas.....	☐	☐	☐
Electricity.....	☐	☐	☐
Fuel oil, kerosene, etc.....	☐	☐	☐
Other fuel.....	☐	☐	☐
No fuel used.....	☐	☐	☐

Direct interview

H22. What fuel is used most for—

	Heating this unit	Cooking	Heating water
Coal or coke.....	☐	☐	☐
Wood.....	☐	☐	☐
Utility gas.....	☐	☐	☐
Bottled, tank, or LP gas.....	☐	☐	☐
Electricity.....	☐	☐	☐
Fuel oil, kerosene, etc.....	☐	☐	☐
Other.....	☐	☐	☐
No fuel used.....	☐	☐	☐

(The washer-dryer combination is tabulated under clothes washing machine.)

A clothes dryer owned by a member of the household was to be reported whether it was located in the housing unit or elsewhere on the property. Dryers used but not owned by members of the household, such as those provided by the management of an apartment building, were not to be reported.

The 1960 Census is the first census to provide information on clothes dryers.

Home food freezer (H28).—A home food freezer is defined as an appliance, separate from the refrigerator, which freezes food and keeps it frozen. The freezer must be located in the housing unit or elsewhere on the property. Excluded is a freezer combined in the same cabinet with a refrigerator, even if it has a separate door.

The 1960 data are not comparable with data on refrigeration from earlier censuses. In 1950 and 1940, information as to mechanical or nonmechanical refrigeration equipment was reported but no information was obtained on separate appliances for freezing food.

Telephone available (H35).—A unit is classified as having a telephone if there is a telephone available to the occupants of the unit for receiving calls. The telephone may be located inside or outside the housing unit, and one telephone may serve the occupants of several units. The number of housing units with telephones available, therefore, does not indicate the number of subscribers or the number of telephones installed in homes.

No data on telephones were collected in censuses prior to 1960.

Automobiles available (H36).—The count of automobiles available represents the number of passenger automobiles, including station wagons, owned or regularly used by any of the occupants of the housing unit. Passenger cars were to be counted if they were owned by a member of the household or if they were regularly used and ordinarily kept at home, such as some company cars. Not to be counted were taxis, pickups or larger trucks, and dismantled or dilapidated cars in an early stage of being junked. The statistics do not reflect the number of automobiles privately owned or the number of households owning one or more automobiles.

Data on automobiles were not collected in censuses prior to 1960.

Air conditioning (H27).—Air conditioning is defined as the cooling of air by refrigerating apparatus. Excluded are evaporative coolers and fans or blowers which are not connected to a refrigerating apparatus. A room unit is an individual air conditioner designed to cool one room. A central system is an installation which air conditions a number of rooms. In an apartment building, a central system usually provides air conditioning for all the apartments.

Air conditioning was not included in the 1950 or earlier censuses.

Television sets (H25).—Sets of all kinds located in the unit were to be included in the count—floor, table, built-in, portable, and combination with radio or phonograph. Sets in working order and sets being repaired were to be counted. A combination radio-television set was to be reported both as a television and as a radio set.

The 1960 statistics are comparable with data from the 1950 Census, which was the first census to include this item. Both censuses provide the count of occupied units having at least one television set (and in 1960 those having two or more), although the total number of television sets was not determined.

Radio sets (H26).—Sets of all kinds located in the unit were to be included in the count—floor, table, portable, and combination with television, phonograph, or clock. Sets in working order and sets being repaired were to be counted. A combination radio-television set was to be reported both as a radio and as a television set. The following types of radios were to be excluded from the count: Sets which were not in working order and were not being repaired, automobile radios, sending-receiving sets ("ham radio" sets) and crystal sets ("cat whisker" sets).

The 1960 statistics are comparable with data from the 1950 and 1940 Censuses. All three censuses provide the count of occupied units having at least one set (and in 1960 those having

two or more), although the total number of radio sets was not determined. The number of units (families) with a radio set was provided also in 1930 as part of the 1930 Census of Population (see section on "Housing data from other censuses").

Fuels.—Information on fuel is provided for occupied units only. The figures represent the principal fuel used for heating the unit, for cooking, and for heating water, respectively. For fuels supplied by utility companies, the census data are not likely to be comparable with utility company reports on the number of residential customers for that fuel. Generally, utility company data are based on a count of meters or the number of bills rendered. Several households which are served by one meter are usually counted as one customer by the utility companies but as several housing units in the reports of the Bureau of the Census. On the other hand, the count of meters may include some meters for units that are vacant. Furthermore, the utility companies generally report each customer regardless of the amount of fuel used, while the census reports the fuel if it is the principal fuel used for the specified purpose.

Heating fuel (H22).—The fuel to be reported was the fuel used most for heating the unit. In reporting gas as the fuel, a distinction was made between "utility gas" and "bottled, tank, or LP gas." Utility gas is piped in from a central system serving the community. Such gas is supplied by a public utility company, municipal government, or similar organization. Bottled, tank, or LP (liquefied petroleum) gas is supplied in containers which are replaced or refilled as necessary. "Fuel oil, kerosene, etc." includes fuel oil, kerosene, gasoline, alcohol, and other combustible liquids. "Other fuel" includes purchased steam, waste materials (such as corncobs), and other fuels not specified among those listed on the enumeration forms. In some tables where "wood" is not shown separately, it is included in the category "other fuel."

Comparable data on fuel used for heating the unit were collected in 1950 except that separate distributions were provided in 1950 for units with central heating equipment and those with noncentral equipment. Although the definitions of the types of fuel are the same in both censuses, the wording of some of the categories is more specific in 1960. For example, the 1960 category "bottled, tank, or LP gas" is identical with the 1950 "bottled gas"; "fuel oil, kerosene, etc." of 1960 is the same as "liquid fuel" of 1950; and "coal or coke" in 1960 is equivalent to "coal" in 1950.

The data collected in the 1940 Census also are comparable with the data collected in 1960. In 1940, however, the one category "gas" included both utility gas and bottled, tank, or LP gas.

Cooking fuel (H22).—The fuel to be reported was the fuel that was used most for cooking. The definitions of the categories are the same as those for heating fuel.

Comparable data on cooking fuel were provided in both the 1950 and 1940 Censuses, with categories similar to those for heating fuel.

Water heating fuel (H22).—The fuel to be reported was the fuel that was used most for heating water. If the unit had no piped hot water, it was tabulated as using no fuel for heating water. The definitions of the categories are the same as those for heating fuel.

No information on water heating fuel was collected in censuses prior to 1960.

FINANCIAL CHARACTERISTICS

The items on value and rent appeared both on the forms used in self-enumeration and on the forms used in direct interview. In cities and localities for which housing statistics are provided for city blocks, value and rent (items H15 and H16) appeared as self-enumeration items on the Advance Census Report; these items, as well as the questions on the costs of utilities and fuel, appeared as self-enumeration items on the Household Questionnaire, which was used in two-stage areas. The description of the property to which the value figure applied was determined largely by the enumerator and was not reported directly by the respondent.

Value (H15, H40).—Value is the respondent's estimate of how much the property would sell for on the current market (April 1960). Value data for owner-occupied units are restricted to units having only one housing unit in the property and no business. A business for this purpose is defined as a clearly recognizable commercial establishment such as a restaurant, store, or filling station. Units in multiunit structures and trailers were excluded from the tabulations; and in rural territory units on farms and all units on places of 10 acres or more (whether farm or nonfarm) also were excluded. The values of such units are not provided because of heterogeneity in the use and size of the property.

A property generally consists of the house and the land on which it stands. The estimated value of the entire property, including the land, was to be reported, even if the occupant owned the house but not the land, or the property was owned jointly with another owner.

For vacant units, value is the price asked for the property. The price is the amount asked at the time of enumeration and may differ from the price at which the property is sold. Data for vacant units are restricted to properties available for sale which have only one housing unit and no business. Units in multiunit structures were excluded from the tabulations; and in rural territory units on places of 10 acres or more also were excluded. (Data do not reflect sale price of trailers since vacant trailers were not enumerated.)

The median value of housing units is the theoretical value which divides the distribution into two equal parts—one-half the cases falling below this value and one-half the cases exceeding this value. In the computation of the median, the lower limit of a class interval was assumed to stand at the beginning of the value group and the upper limit at the beginning of the successive value group. Medians were rounded to the nearest hundred dollars. The median was computed on the basis of the tabulation groups in full detail as shown in the tables for the United States or State totals, and the terminal category used in the collection of the data was "\$35,000 or more." For vacant units, however, the terminal category used in the tabulation was "\$25,000 or more" for some areas. Thus, a median above \$25,000 (for example, a median of "28,600" for owner-occupied units) is not necessarily higher than a median of "25,000+" for vacant units.

Average value (arithmetic mean) of owner-occupied units is provided in the State chapters for places of 1,000 to 2,500 inhabitants. The average was computed by dividing the sum of the

RENT, UTILITIES AND FUEL IN RENT

Self-enumeration

H16 (H41). If you pay your rent by the month—

What is your monthly rent?

\$.00

(nearest dollar)

OR

If you pay your rent by the week or some other period of time—

What is your rent and what period does it cover?

\$.00 per

(nearest dollar) (week, year, etc.)

H43 and H44. In addition to rent, do you also pay for—

Electricity?

Yes..... ☐ What is the average monthly cost for electricity?No..... ☐ \$.00

Gas?

Yes..... ☐ What is the average monthly cost for gas?No..... ☐ \$.00

Water?

Yes..... ☐ What is the average monthly cost for water?No..... ☐ \$.00

H45 and H46. In addition to rent, do you also pay for oil, coal, kerosene, or wood?

Yes..... ☐ About how much do you pay for such fuel per year?No..... ☐ \$.00

HOW TO FIGURE COST OF UTILITIES AND FUEL

Enter the cost to the nearest dollar.

Utilities—If you don't know exactly how much you have spent and if you don't have records, put down the approximate costs.

Fuels—If you don't know how much fuels cost per year, one of the following methods may help you figure the approximate costs:

Coal—Multiply number of tons used per year by the cost per ton.

Oil or kerosene—Multiply number of gallons used per year by the cost per gallon; OR multiply number of deliveries by average cost per delivery.

Wood—Multiply number of cords (or loads) used per year by cost per cord (or load).

Note: If you buy fuel in small quantities (such as kerosene by the can, or coal by the bag), it may be easier to figure about how much you spend for fuel per week, and multiply by the number of weeks during which it is used.

Direct interview

H16 (H41). What is the monthly rent (for this unit)?

In 1950, value data were published for owner-occupied units and for vacant units available for sale (with the two groups combined for places with a population under 10,000). The data were restricted to nonfarm units (excluding trailers) with only one unit in the property and no business. In rural areas, the 1950 data for both owner-occupied and vacant units excluded values for farm units but included nonfarm units on places of 10 acres or more.

Another difference between 1960 and 1950 statistics is in the method of reporting value amounts. In 1960, respondents were asked to select an appropriate class interval, whereas in 1950 specific figures were given by the respondents. This difference is not believed to affect comparability of the data to an important extent.

To take account of the rise in value of property since 1950, new class intervals were established for presenting the data. The lowest tabulation group in 1960 is "less than \$5,000" and the highest for the larger areas is "\$35,000 or more." In 1950, the lowest and highest intervals for the larger areas were "less than \$2,000" and "\$20,000 or more." The class intervals in 1960 were set so that combinations of value groups could be made for comparison from census to census.

The 1960 value data indicate value levels in 1960 and do not reflect changes since 1950 for identical units. Besides additions through new construction and other sources, and losses through demolition and other means, there have been changes in the owner-occupied inventory through shifts in tenure. Furthermore, there has been some shifting between farm and nonfarm residence as well as a change in the definition of farm residence. (For changes in value of "same" units, see 1960 Census of Housing, Volume IV, Components of Inventory Change, Part 1B.)

Data on value of owner-occupied units were collected for farm as well as nonfarm units in the 1940 Census of Housing and for nonfarm units (homes) in the 1930 Census of Population. The data are not strictly comparable with data from the 1950 and 1960 Censuses. In the 1930 and in some of the 1940 publications (Volume II of the 1940 Housing reports), value data were not restricted to 1-unit properties. In Volume III of the 1940 Housing reports, however, statistics for 1-family structures without business are provided for the United States, regions, States, principal metropolitan districts, and cities of 100,000 inhabitants or more. Comparability is affected to some extent by the differences in the definitions of farm-nonfarm residence.

Data for 1950 and earlier in the text tables in the United States Summary chapter are expressed in current dollars (the dollar value at the time of the respective censuses).

Contract rent (H16, H41).—Contract rent is the monthly rent agreed upon regardless of any furnishings, utilities, or services that may be included. If the rent includes payment for a business unit or additional housing units, an estimate of the rent for the housing unit being enumerated is to be reported. Rent paid by lodgers or roomers in the household is disregarded. For vacant units, rent is the amount asked for the unit; the rent is the amount asked at the time of enumeration and may differ from the rent contracted for when the unit is occupied. Data for vacant units are restricted to vacant units available for rent. In rural territory, data for renter-occupied units exclude rents for farm housing units, and data for vacant units exclude rents for units on places of 10 acres or more.

The median rent is the theoretical rent which divides the distribution into two equal parts—one-half the cases falling below this rent and one-half the cases exceeding this rent. In the computation of the median, the lower limit of a class interval was assumed to stand at the beginning of the rent group and the upper limit at the beginning of the successive rent group. The median was computed on the basis of more tabulation groups than are shown in the tables, and the terminal category was \$150 or more. Medians were rounded to the nearest whole dollar.

values by the number of owner-occupied units for which value is shown. For purposes of the computation, the midpoints of the intervals were used except that a mean of \$3,500 was assigned to values less than \$5,000 and a mean of \$42,000 was assigned to values of \$35,000 or more. (In 1950, averages for these places were computed from the specific amounts reported.)

Renter-occupied units for which "no cash rent" is paid (see definition of tenure) are excluded from the computation of the median; and in tables 21, 24, 26, 30, and 32 in the State chapters, such units are also excluded from the count of "renter occupied" units shown under "Contract rent."

Medians for vacant units are provided for two kinds of available vacant units—those for which the rent includes payment for all utilities and fuel, and those for which the rent includes only some or none of the utilities and fuel. (Refer to the section on "Gross rent" for discussion of utilities and fuel.)

Rent data were published in 1950 for renter-occupied units and for vacant units available for rent (with the two groups combined for places with a population under 10,000). In rural areas, the 1950 rent data for both the renter-occupied and vacant units excluded rents for farm units.

To take account of the rise in rents since 1950, new class intervals were established for presenting the figures. However, the class intervals in 1960 were set so that combinations of rental groups could be made for comparison from census to census.

The 1960 rent data indicate rent levels in 1960 and do not reflect changes since 1950 for identical units. In addition to new units coming on the market and withdrawals from the inventory, there have been changes in the renter-occupied inventory through shifts in tenure. Furthermore, there has been some shifting between farm and nonfarm residence as well as a change in the definition of farm residence. (For change in rent of "same" units, see *1960 Census of Housing, Volume IV, Components of Inventory Change, Part 1B.*)

Changes reflected by the 1960 and 1950 Census data are not comparable with changes in rents obtained by the Bureau of Labor Statistics for its Consumer Price Index. The data compiled by the Bureau of Labor Statistics represent changes in rent for essentially similar units with comparable services and facilities.

In 1940, the Census of Housing provided contract rent data for renter-occupied nonfarm units and estimated rents for farm units, owner-occupied units, and vacant units. In 1930, the Census of Population provided rent statistics for rented nonfarm units (homes). In areas which included rural housing, comparability with the later censuses is affected by the change in the definition of farm residence.

Data for 1950 and earlier in the text tables in the United States Summary chapter are expressed in current dollars (the dollar rent at the time of the respective censuses).

Gross rent.—The computed rent termed "gross rent" is the contract rent plus the average monthly cost of utilities (water, electricity, gas) and fuels such as wood, coal, and oil if these items are paid for by the renter (or paid for him by a relative, welfare agency, or friend) in addition to rent. Thus, gross rent eliminates differentials which result from varying practices with

respect to the inclusion of utilities and fuel as part of the rental payment. Rent data exclude rents for farm units in rural territory. (Gross rent data for housing units with nonwhite household heads, Puerto Rican heads, and heads of Spanish surname in the detailed tables erroneously include data for farm units; see section on "Corrections.")

The procedures to be followed by the enumerator for determining the costs of utilities and fuels conformed to the instructions given to the respondents on the self-enumeration form. The costs of fuels were reported on a yearly basis and converted to a monthly estimate in the tabulation processes. If the utility or fuel bill covered a business unit or additional housing units, an amount was to be reported for the one housing unit being enumerated. If the renter had just moved into the unit, the cost of the item was to be estimated on the basis of recent experience and general knowledge of utility and fuel costs. Gross rent is not computed for units for which "no cash rent" is paid (see definition of tenure) even though the renter may pay for utilities or fuel.

The median rent is the theoretical rent which divides the distribution into two equal parts—one-half the cases falling below this rent and one-half the cases exceeding this rent. The median was computed in the same manner as the median contract rent. It was computed on the basis of more tabulation groups than are shown in the tables, and the terminal category was "\$200 or more." Medians were rounded to the nearest whole dollar. Renter-occupied units for which "no cash rent" is paid are shown separately in the tables and are excluded from the computation of the median.

Average gross rent (arithmetic mean) is provided in the State chapters for places of 1,000 to 2,500 inhabitants. The average was computed by dividing the sum of the rental amounts by the number of renter-occupied units, excluding units for which "no cash rent" was paid and excluding farm units in rural areas.

Data on gross rent were published in 1950 and in 1940 for renter-occupied units, excluding farm units in rural areas. In both 1950 and 1940, an additional adjustment was made to gross rent; if the use of furniture was included in the contract rent, the reported estimated rent of the unit without furniture was used in the computation. In areas which include rural housing, comparability with 1960 data is also affected by the change in the definition of farm residence.

Data for 1950 and earlier in the text tables in the United States Summary chapter are expressed in current dollars (the dollar rent at the time of the respective censuses).

Rent status.—Renter-occupied units comprise units rented for cash and units for which no cash rent is paid. "No cash rent" is shown as a separate category in the distributions for contract rent and gross rent; in the State chapters, the category is shown under "Rent status" in the county table for rural-farm units (table 34). See also section on "Tenure."

COLLECTION AND PROCESSING OF DATA

The collection and processing of data in the 1960 Census differed in several important respects from the procedures used in the 1950 Census. Much of the information in 1960 was obtained by self-enumeration supplemented by follow-up procedures, in contrast to direct interview in 1950; a two-stage census was introduced in the more populous sections of the country, representing about four-fifths of the population; and much greater use was made of sampling than in 1950. A further innovation was the formal field review of the enumerator's work during the course of enumeration. Finally, extensive use was made of electronic equipment in 1960 to process the data and produce the final tables.

A summary of the procedures for collecting and processing the data is given below. Some of the forms are illustrated in the appendix to the United States Summary chapter of Volume I of the 1960 Housing reports; instructions from the Enumerator's Reference Manuals for enumerating some of the items are included also. Additional information on the 1960 practices is given in *United States Censuses of Population and Housing, 1960: Principal Data Collection Forms and Procedures*. A detailed description of the collection and processing of data is provided in the report entitled *Eighteenth Decennial Census: Procedural History*. The schedule used in the 1950 Census of Housing and instructions from the 1950 Enumerator's Reference Manual are

reproduced in the United States Summary chapter of *1950 Census of Housing, Volume I, General Characteristics*; a description of the collection and processing of data is given in the report entitled *The 1950 Censuses—How They Were Taken*.

COLLECTION OF DATA

Data-collection forms.—Two basic types of forms were used for collecting data in the 1960 Census—the forms which respondents were asked to fill and the forms used by the enumerator to record the information for processing.

Advance Census Report and Household Questionnaire.—Both the Advance Census Report (ACR) and the Household Questionnaire were self-enumeration forms. The ACR contained items which were to be reported for all occupied housing units and was used on a nationwide basis. The Household Questionnaire contained questions which were asked on a sample basis and was used in the more populous areas.

FOSDIC schedules.—The FOSDIC schedules are forms specially designed for electronic data processing. Two basic types were used—a “complete count” FOSDIC schedule and a “sample” FOSDIC schedule. The complete-count FOSDIC schedule contained items enumerated for every housing unit. Information was either transferred from the ACR or recorded on the schedule during direct interview. This schedule was used also for recording information not called for on the ACR, namely access to unit (which is pertinent to the identification of a housing unit), condition of the unit, and information about vacant units. The sample FOSDIC schedule contained items that were enumerated on a sample basis. Information was either transferred from the Household Questionnaire or recorded on the schedule during direct interview.

Enumeration procedures.—Before the enumeration began, the Post Office Department delivered an ACR to households on postal delivery routes in all parts of the United States. This form contained questions which were to be answered for every occupied housing unit. Household members were requested to fill the ACR and have it ready for the enumerator when he called.

Two-stage and single-stage procedures.—The enumeration process involved two basic procedures. In the densely populated areas of the United States (with approximately 82 percent of the population and 35 percent of the land area), a “two stage” enumeration procedure was used. In the first-stage visit to the housing unit (Stage I), the enumerator transferred information from the ACR to the complete-count FOSDIC schedule. If the ACR was not filled for the unit or if the form had omissions or inconsistencies, the enumerator was instructed to ask the questions and record the answers directly on the FOSDIC schedule. If the household was in the sample, the enumerator left a Household Questionnaire to be filled and mailed promptly to the local census office. It was also necessary for the Stage I enumerator to transfer the complete-count information for each sample household to its sample FOSDIC schedule. This schedule was then given to the Stage II enumerator.

In the second stage (Stage II), the enumerator transferred the information supplied by the household from the Household Questionnaire to the sample FOSDIC schedule. If the enumerator found that the questionnaire was incompletely filled or had not been mailed, or if he detected answers containing obvious inconsistencies, he obtained the missing information by personal visit or by telephone and recorded it directly on the sample FOSDIC schedule (or on the Household Questionnaire and then on the FOSDIC schedule).

In the rest of the United States, where approximately one-fifth of the population lives, a “single stage” enumeration procedure was used.⁷ As in the two-stage areas, the enumerator visited the housing unit and transferred information from the ACR to the complete-count FOSDIC schedule. If the ACR was not filled for the unit or if the form had omissions or inconsistencies, the enumerator was instructed to ask the questions and record the answers directly on the FOSDIC schedule. For each

unit in the sample, the enumerator asked the questions for the sample items and recorded the answers directly on the sample FOSDIC schedule. The Household Questionnaire was not used in single-stage areas.

Thus, the “two stage” and “single stage” procedures differ only in the method of obtaining information for the sample items.

Methods of obtaining information.—Information for the housing items was obtained through self-enumeration, direct interview, and observation. The method used for each item and the enumeration form on which the item appears are indicated in the section on “Definitions and explanations.”

Procedure for vacant units.—In both two-stage and single-stage areas, information for vacant units was obtained by the enumerator and recorded directly on the FOSDIC schedule. Information was obtained from owners, landlords, neighbors, or other persons presumed to know about the unit. For each vacant unit in the sample, the enumerator in single-stage areas completed the sample FOSDIC schedule at the same time he obtained the complete-count information. In two-stage areas, the Stage II enumerator completed the sample FOSDIC schedule.

Listing procedure.—As a means toward obtaining complete coverage of housing units, the enumerator in both two-stage and single-stage areas listed each occupied and vacant unit on his first visit to the unit for information from the ACR. He was instructed to canvass each block, street, or road in a systematic manner and to record the address, name of head (of occupied unit), time to call if a callback was required, and other pertinent information about the visit. A Listing Book was used for this purpose.

Field review.—One of the important innovations in the 1960 Census was a series of regularly scheduled “field reviews” of the enumerator's work by his crew leader or by a field reviewer. This operation was designed to assure at an early stage of the work that the enumerator was performing his duties properly and had corrected any errors he had made. Moreover, the completeness of coverage of housing units was checked in various ways, including for the first time a comparison of addresses listed by the enumerator with an advance partial listing of addresses prepared by the supervisor.

PROCESSING OF DATA

Electronic processing.—Although mechanical equipment was widely used in the 1950 and 1960 Censuses in the editing, coding, and tabulating of housing data, the procedures adopted in 1960 differed in several important respects from those used in 1950. The procedural changes reflected, in large part, the shift from conventional mechanical equipment to electronic equipment, which had been applied to the processing of housing information on a relatively limited scale in 1950.

In 1960, the enumerator recorded housing information by shading appropriate circles on FOSDIC schedules. To process the data, (1) the schedules were sent to the central processing office in Jeffersonville, Indiana, where they were microfilmed; (2) the microfilm was then sent to Washington, D.C., where the markings were converted to signals on magnetic tape by FOSDIC (Film Optical Sensing Device for Input to Computers); (3) the tape was processed by an electronic computer, which edited, coded, and tabulated the data; (4) a high-speed electronic printer printed the numbers, captions (column heads), and stubs on sheets to which preprinted titles were added, and the tables were reproduced by offset printing (except for the tables in the United States Summary chapter of Volume I, which were typed manually).

In 1950, the enumerator recorded housing information by marking a precoded check box or writing a numerical answer. To process the data, (1) clerks punched a card for each unit containing the codes for the housing characteristics; (2) the punchcards were edited, coded, and tabulated by conventional tabulators

⁷ States enumerated completely on a single-stage basis were: Alaska, Arkansas, Hawaii, Idaho, Mississippi, Montana, Nevada, New Mexico, North Dakota, South Dakota, and Wyoming. States enumerated partly, but not completely, on a single-stage basis were: Alabama, Arizona, California, Colorado, Florida, Georgia, Kansas, Kentucky, Louisiana, Maine, Michigan, Minnesota, Nebraska, Oklahoma, Oregon, Texas, Utah, Washington, and Wisconsin.

for all the 1950 Housing reports except Volume II, for which electronic equipment was used for the tabulations; (3) the tables (except in the reports on block statistics) were typed manually on sheets with preprinted stubs and partially preprinted captions, and the tables were reproduced by offset printing.

The extensive use of electronic equipment in the 1960 Census insured a more uniform and more flexible edit than could have been accomplished manually or by less intricate mechanical equipment. In the editing operations, improved techniques of allocation for nonresponses and inconsistencies were feasible. Moreover, the use of FOSDIC completely eliminated the cardpunching operation and thereby removed one important source of error in the published statistics; the new types of error introduced by the use of FOSDIC were probably minor by comparison.

The electronic computer made it possible to do much more complex editing and coding than in earlier censuses and to assure consistency among a larger number of interrelated items. For example, the computer assigned a code to each housing unit for one of seven categories of condition and plumbing facilities; to determine this code in some instances required the scanning of entries in four items, where a full cross-classification of the items would involve approximately 36 combinations of categories. At the same time, the greater capacity of the computer permitted the keeping of a detailed record of the extent of computer editing.

In 1960, practically all the editing and coding operations on the housing schedules were accomplished by electronic equipment. The only schedules examined manually (after the field review and inspection) were those flagged by the computer for clerical review because the number of corrections required exceeded the tolerances that were established. In 1950 also, much of the editing and coding was accomplished by mechanical equipment, including electronic equipment for some tabulations. A few specified items on the housing schedules in 1950 were examined manually, and corrected when necessary, before the schedules were processed mechanically.

Editing.—In a mass statistical operation, such as a national census, human and mechanical errors occasionally arise in one form or another, such as failure to obtain or record the required information, recording information in the wrong place, misreading position markings, and skipping pages. These were kept to a tolerable level by means of operational control systems. Nonresponses and inconsistencies were eliminated by using the computer to assign entries and correct inconsistencies. In some cases, missing and inconsistent entries resulted from poor markings which were unreadable or were misread by FOSDIC. In general, few assignments or corrections were required, although the amount varied by subject and by enumerator.

Whenever information was missing, an allocation procedure was used to assign an acceptable entry, thereby eliminating the need for a "not reported" category in the tabulations. The assignment was based on related information reported for the housing unit or on information reported for a similar unit in the immediate neighborhood. For example, if tenure for an occupied unit was omitted but a rental amount was reported, the computer automatically edited tenure to "rented." On the other hand, if the unit was reported as "rented" but the amount of rent was missing, the computer automatically assigned the rent that was reported for the preceding renter-occupied unit.

A similar procedure was used when the information reported for an item was inconsistent with other information reported for the unit. For example, if a housing unit was enumerated as having "no running water" but having both a bathtub (or shower) and flush toilet for the exclusive use of the occupants of the unit, the computer edited water supply to "hot and cold water," a category considered to be consistent with the reported bathing and toilet facilities.

Specific tolerances were established for the number of computer allocations acceptable for a given area. If the number was beyond

tolerance, the data were rejected and the original schedules were re-examined to determine the source of the error. Correction and reprocessing were undertaken as necessary and feasible. In some cases, the corrective action consisted simply of making darker shadings in the code circles. If the high number of allocations resulted from faulty entries or absence of entries on the schedules, the appropriateness of the computer allocations was considered and, in some instances, a manual allocation was substituted.

The extent of the allocations for nonresponses or for inconsistencies, including those resulting from poor markings, is shown for each item in appendix table A-1 in the individual chapters for States. The percentages reflect only the allocations made by the computer; they exclude any that were made in the field review of the census schedules and those that were made manually after they had been rejected by the computer. The table presents totals for the State, by inside and outside SMSA's, and totals for places of various population size groups. The base on which the percentage is computed is shown for each item. For most items, the percentages are based on all housing units or occupied housing units. In some instances, the base is a specific group of units. For example, a figure of 2.5 for "duration of vacancy" for places of 50,000 inhabitants or more means that answers to this question were supplied or edited for 2.5 percent of the vacant units available for rent or sale; the percent is a combined figure for all places of 50,000 inhabitants or more in the State. Percentages are not shown if the item is not published for the specified area.

In earlier censuses, assignments of acceptable entries for nonresponses and inconsistencies also were based on related information given for the units. In the absence of related information for the unit, either an acceptable code was assigned or the item was "not reported." If a code was assigned, it was made on the basis of distributions of characteristics from previous censuses or surveys. The use of electronic equipment in 1960 improved upon the procedure by making feasible the use of information implicit in the 1960 data being tabulated.

ACCURACY OF DATA

As explained above, information was obtained through self-enumeration and direct-interview procedures. The forms used by household members for self-enumeration were necessarily different from those used by the enumerator in direct interview, although the intent of the two types of forms was the same. The use of self-enumeration forms allowed household members to see the questions as worded and to consult household records to ascertain the correct answers. Furthermore, the self-enumeration forms provided brief but uniform explanations for some of the items and called attention to the response categories in a uniform manner. The less detailed wording of some items on the FOSDIC schedules was supplemented by the training and instructions given to the enumerators. The enumerators received standardized and formal training in canvassing their districts, in interviewing, and in filling out the schedules. During training, they used a workbook which contained practice exercises and illustrations. Filmstrips with accompanying narratives and recorded interviews were also used. The fine distinctions made in the instructions, however, were probably not ordinarily conveyed to the respondents, unless they asked the enumerator for clarification of a particular point.

Some of the areas for which separate statistics are provided in Volume I are areas with relatively small numbers of housing units, and the enumeration represents the work of only a few enumerators. Moreover, such items as the delineation of living quarters and the classification of the condition of a housing unit were always determined by the enumerator. To the extent that answers to other census questions were obtained by direct interview, responses may have been affected by misunderstanding on

the part of the enumerator. Therefore, misinterpretation of the instructions or variation in interpretation of responses may have led to a wider margin of relative error and response variability in data for small areas (places with relatively small population, or the rural-nonfarm and rural-farm parts of counties) than for large areas. The systematic field review early in the enumeration corrected some of the errors arising from misunderstandings by the enumerator.

In the processing of the data, careful efforts were made at each step to reduce the effects of errors. Errors occurred through failure to obtain complete and consistent information, incorrect recording of information on the FOSDIC schedules or incorrectly transferring it from the self-enumeration forms, faulty marking of the FOSDIC schedules, and the like.

Some of the innovations in the 1960 Census reduced errors and others produced a more consistent quality of results. It is believed that the innovations have improved the quality of the results compared with those of earlier censuses but, at the same time, have introduced an element of difference in the statistics. According to present plans, one or more reports

evaluating the statistics of the 1960 Census of Housing will be published later.

Statistics such as the number of owner-occupied and renter-occupied units usually appear in more than one table for a given area. These figures may differ between tables, or in the same table, when characteristics of these units were tabulated at different sample rates; for example, the number of units tabulated by condition and plumbing facilities may differ from the number tabulated by bathrooms (see table I and the section on "Ratio estimation"). In the case of financial characteristics, certain types of units were excluded from the tabulations; therefore, differences between the counts obtained from the value and rent distributions and corresponding counts from distributions for other characteristics may reflect the exclusion of these units.

Statistics in this report may differ from those in other reports from the 1960 Census of Housing where different sample rates were used for the same item. Moreover, in some cases, differences caused by errors in enumeration or processing were discovered after the publication of the early reports and were corrected in subsequent reports.

SAMPLE DESIGN AND SAMPLING VARIABILITY

SAMPLE DESIGN

Although some information was collected for all housing units in 1960, information for most of the items was collected for samples of housing units. The enumerator was instructed to assign a Sample Key letter (A, B, C, or D) to each housing unit sequentially in the order in which he first visited the unit, whether or not he completed the interview. Each enumerator was given a random key letter to start his assignment, and the order of canvassing was indicated in advance, although the instructions allowed some latitude in the order of visiting individual units at an address. Each housing unit which was assigned the key letter "A" was designated as a sample unit.

Information for each housing unit in the sample was recorded on a sample FOSDIC schedule. The schedules were bound in books which were so arranged that every fifth sample FOSDIC schedule carried housing questions comprising the 5-percent sample items; the other four-fifths carried questions comprising the 20-percent sample items. Items which appeared on both types of schedules comprised the 25-percent sample items. Thus, sample items were based on 5, 20, or 25 percent of the housing units; for these items the tabulations were based on the full 5-, 20-, or 25-percent sample, respectively. For items enumerated for all housing units, however, the tabulations were not always based on the complete count; data for some of these items were tabulated from a sample of units, particularly for areas with large population. Furthermore, the same item may be tabulated at different rates within this volume. The use of different rates was determined largely by the amount of detail to be tabulated.

Although the sampling procedure did not automatically insure an exact 25-, 20-, or 5-percent sample of housing units in each area, the sample design was unbiased if carried through according to instructions. Generally, for large areas, the deviation from the estimated sample size was found to be quite small. Small biases arose, however, when the enumerator failed to follow the listing and sampling instructions exactly. The 25-percent sample as finally processed comprised 24.53 percent of the total occupied housing units and 24.71 percent of the total population in the United States as a whole.

Sample rate for tabulation.—The rate at which an item was tabulated in the 1960 Census is given in table I. To illustrate,

in the United States Summary chapter, condition and plumbing facilities and number of rooms were tabulated from the complete count (100 percent) for vacant units and from the 25-percent sample for the distributions of "owner occupied," "renter occupied," and "all" units. The rates given in table I apply to the 1960 data in the text tables as well as in the detailed tables.

In the State chapters, condition and plumbing facilities for renter-occupied units were tabulated from the 25-percent sample for table 12 and from the complete count (100 percent) of units for table 25; value for owner-occupied units was tabulated from the 25-percent sample for each table in which it is presented; and the distribution and median number of persons for "all" occupied units in table 26 were based on the 100-percent count, whereas the medians for owner- and renter-occupied units were computed from the 25-percent sample. Data on number of units in structure were tabulated from the 20-percent sample for owner-occupied, renter-occupied, and vacant units. Data on number of rooms for vacant units in table 3 in the State chapters were tabulated from the 100-percent count of vacant units; data on rooms for all units in table 3 were tabulated from the 25-percent sample of occupied and vacant units. Unless otherwise specified, the sample rate for the subject is applicable to the medians and averages as well as the distributions.

Medians were computed from distributions based on weighted samples tabulated at the rate indicated for the subject in table I. Medians, averages, and percentages are not shown where the base is smaller than the required minimum. For items tabulated from the complete count, the minimum base is 50 units; for the 25-percent sample, the minimum base is 200 units; and for the 20-percent sample, the minimum base is 250 units. For population per occupied unit, the population figure is considered the base.

In 1950, information was collected on a complete-count basis except for information on heating equipment, electric lighting, refrigeration, kitchen sink, year built, radio, television, heating fuel, and cooking fuel. In the text tables in the United States Summary chapter, the 1950 data for the specified items are based on 20-percent samples of units for conterminous United States and on the complete count for Alaska and Hawaii; the 1950 data for the remaining items and all data from earlier censuses are based on the complete count (see section on "Description of tables").

¹ Refers to counts of units under the subject "Tenure, color, and vacancy status."² Under the subject "Tenure" or "Tenure, color, and vacancy status," the counts of vacant units are based on the 100-percent enumeration; the counts of owner- and renter-occupied units by color are based on the 25-percent sample and, because they are major components in the ratio estimation, are essentially in agreement with the complete count except when tabulated by farm-nonfarm residence. These counts appear as control totals in various tables for the area; totals of distributions for characteristics based on samples of different size may not agree precisely with these counts (see section on "Ratio estimation").³ For owner- and renter-occupied units, median number of persons and median number of rooms were computed from the 25-percent sample of units.⁴ Based on the 100-percent enumeration in text tables D and F.⁵ For automobiles, 20-percent sample in places of 50,000 inhabitants or more in 1950 or in an interim census prior to 1960; 5-percent sample elsewhere. For rent and value of vacant units, 100-percent in places of 50,000 inhabitants or more in 1960 for which statistics are published by blocks in *1960 Census of Housing*, Volume III, *City Blocks*; 25-percent sample elsewhere. For an area including a place of 50,000 inhabitants or more (e.g., a region, division, or SMSA), the parts were tabulated at their respective rates and then combined.**NOTE.**—The 1950 data in the text tables of the United States Summary chapter are based on the complete count, except in continuous United States data on age of structure, radio, television, cooking fuel, and heating fuel are based on the 20-percent samples subject to ratio estimation. The 1940 data are based on the complete count.

RATIO ESTIMATION

The 1960 statistics based on samples of housing units are estimates that were developed through the use of a ratio estimation procedure. Essentially this procedure was carried out for each of seven groups of housing units in each area, separately for the 25-, 20-, and 5-percent samples.⁸ The groups are as follows:

Group	Tenure, color, vacancy status
1	Owner occupied, white
2	Owner occupied, nonwhite
3	Renter occupied, white
4	Renter occupied, nonwhite
5	Vacant, available for sale only
6	Vacant, available for rent
7	Vacant, other

For each of the seven groups, the ratio of the complete count to the sample count of housing units in the group was determined. Each sample housing unit in the group was assigned an integral weight so the sum of the weights would equal the complete count for the group. For example, if the ratio for a group was 4.2, one-fifth of the housing units (selected at random) within the group were assigned a weight of 5, and the remaining four-fifths, a weight of 4. The use of such a combination of integral weights rather than a single fractional weight was adopted to avoid the complications involved in rounding. For the 25-percent sample tabulations, where there were fewer than 50 housing units in the complete count in a group or where the resulting weight would be over 16, groups were, in general, combined in a specific order to satisfy these two conditions. Similar procedures with appropriate values were used for the 20- and 5-percent sample tabulations.

The ratio estimates achieve some of the gains of stratification which would have been obtained if the sample had been stratified by the groups for which separate ratio estimates were computed. The net effect is a reduction in the sampling variability and in the bias of many statistics below that which would be obtained by weighting the results of the 25-percent sample by a uniform factor of 4 (the 20-percent sample by 5 or the 5-percent sample by 20). The reduction in sampling variability is trivial for some items and substantial for others.

The ratio estimation procedure was generally applied to the smallest complete geographic area for which any data were to be published. Thus, the area may be a city, tract within a city, county, SMSA, urbanized area, or the rural part of a county. The rural-farm and rural-nonfarm units in a county, however, do not represent complete areas; therefore, data by rural-farm and rural-nonfarm residence are not subject to the reduction in sampling variability which is achieved by the ratio estimation procedure. Distributions of characteristics which were tabulated at different sample rates may not add to the same total.

The inventory of housing units (counts of all units, owner occupied, renter occupied, and vacant) are provided under the subject "Tenure, color, and vacancy status." In the detailed tables in the United States Summary chapter and in tables 1 to 24 and 28 to 35 in the State chapters, as a byproduct of the ratio estimation procedure, estimates of owner- and renter-occupied

⁸ Estimates of characteristics of the housing units from the sample for a given area are produced using the formula:

$$x' = \sum_{i=1}^7 \frac{x_i}{y_i} Y_i$$

where x' is the estimate of the characteristic for the area obtained through the use of the ratio estimation procedure, x_i is the count of sample housing units with the characteristic for the area in one (i) of the 7 groups, y_i is the count of all sample housing units for the area in the same one of the 7 groups, and Y_i is the complete count of housing units for the area in the same one of the 7 groups.

units by color of head of household (except when tabulated by farm-nonfarm residence) are essentially in agreement with the total numbers of units from the 100-percent counts in the respective groups in each area (occupied units were tabulated from the 25-percent sample and vacant units were tabulated from the 100-percent counts). However, where some of the groups in the ratio estimation procedure were combined, the estimates for owner- and renter-occupied units by color are subject to a relatively small sampling variability. The counts of units which are shown under the subject "Tenure, color, and vacancy status" in the first table for a given area appear as control totals in subsequent tables for the area. For subjects tabulated from the 20-percent or 5-percent sample, the distributions may not add precisely to these control totals.

In tables 25 and 36 to 38 in the State chapters, the counts of owner- and renter-occupied units by color and the counts of vacant units, when presented under the subject "Tenure" or "Tenure, color, and vacancy status," are the 100-percent counts and therefore are not subject to sampling variability. In State table 27, the counts of owner-occupied, renter-occupied, and available vacant units also are the 100-percent counts. In State tables 40 to 42, all the data are subject to sampling variability.

Farm residence was based on the 25-percent sample of units, and estimates of owner- and renter-occupied units by color were inflated to the 100-percent counts for the entire rural portion of a county. The separate counts of rural-nonfarm and rural-farm units, therefore, are subject to sampling variability.

In the text tables in the United States Summary chapter, the 1960 inventory counts are essentially in agreement with the 100-percent counts, as specified in the headnotes. For these figures, the counts are based partly on a sample; figures for owner-occupied and renter-occupied units are based on the 25-percent sample subject to ratio estimation, and the counts of vacant units are based on the 100-percent enumeration. Distributions of characteristics based on samples of units may not add precisely to the inventory counts.

SAMPLING VARIABILITY

Standard error of numbers and percentages.—Figures from sample tabulations are subject to sampling variability. For the 1960 data based on samples, the sampling variability can be estimated by using factors from table IV in conjunction with table II for absolute numbers and with table III for percentages.⁹ These tables do not reflect the effect of response variance, processing variance, or bias arising in the collection, processing, and estimation steps; estimates of the magnitude of some of these factors in the total error are being prepared and will be published at a later date. The chances are about two out of three that the difference due to sampling variability between an estimate based on a sample and the figure that would have been obtained from a complete count is less than the standard error. The chances are about 19 out of 20 that the difference is less than twice the standard error and about 99 out of 100 that it is less than 2½ times the standard error. The amount by which the estimated standard error must be multiplied to obtain other odds deemed more appropriate can be found in most statistical textbooks.

Table II shows estimates proportionate to the standard errors of estimated numbers of housing units. Table III shows estimates proportionate to the standard errors of estimated percentages of housing units. Table IV provides a factor by which the

⁹ These estimates of sampling variability are based on partial information on variances being calculated from a sample of 1960 Census results. Further estimates are being calculated and will be made available.

estimates proportionate to the standard errors shown in tables II and III should be multiplied to adjust for the combined effect of the sample design and the estimation procedure.

TABLE II.—ESTIMATES PROPORTIONATE TO STANDARD ERROR OF ESTIMATED NUMBER
[Range of 2 chances out of 3; for factors to be applied, see table IV and text]

Estimated number ¹	Estimate proportionate to standard error	Estimated number ¹	Estimate proportionate to standard error
50.....	15	5,000.....	110
100.....	20	10,000.....	160
250.....	30	15,000.....	190
500.....	40	20,000.....	220
1,000.....	50	25,000.....	250
2,500.....	80	50,000.....	350

¹ For estimated numbers larger than 50,000, the relative errors are somewhat smaller than for 50,000.

TABLE III.—ESTIMATES PROPORTIONATE TO STANDARD ERROR OF ESTIMATED PERCENTAGE
[Range of 2 chances out of 3; for factors to be applied, see table IV and text]

Estimated percentage	Base of percentage					
	500	1,000	2,500	10,000	25,000	50,000
2 or 98.....	1.3	0.9	0.5	0.3	0.1	0.1
5 or 95.....	2.0	1.4	0.9	0.4	0.2	0.2
10 or 90.....	2.8	2.0	1.2	0.6	0.3	0.2
25 or 75.....	3.8	2.7	1.5	0.7	0.4	0.3
50.....	4.4	3.1	1.6	0.8	0.5	0.3

To estimate a standard error for a given characteristic, locate in table I the sample rate used in the tabulation, and in table IV the factor applying to the item according to the sample rate used; multiply this factor by the estimate proportionate to the standard error given for the number shown in table II. The product of this multiplication is the approximate standard error. Similarly, to obtain an estimate of the standard error of a percentage, multiply the figure as shown in table III by the factor from table IV. For most estimates, linear interpolation in tables II and III will provide reasonably accurate results.

Illustration. Let us assume table 13 in a State chapter shows that in a given city there are an estimated 2,500 housing units with two or more bathrooms. According to table I, data on number of bathrooms in table 13 were tabulated from the 20-percent sample of housing units. Table IV shows that when number of bathrooms is tabulated from the 20-percent sample, the appropriate number in table II should be multiplied by a factor of 1.2. Table II shows that the estimate proportionate to the standard error for an estimate of 2,500 is about 80. The factor of 1.2 times 80, or 96, means that the chances are approximately 2 out of 3 that the results of a complete count would not differ by more than 96 from the estimated 2,500. It also follows that there is only about 1 chance in 100 that the results of a complete count would differ by as much as 240, that is, by 2½ times the standard error. Assume also that table 28 for a State shows there are an estimated 300 dilapidated housing units in a given county. According to table I, the sample rate of tabulation for condition and plumbing is 25 percent, and according to table IV the factor is 1.2. Table II shows that the estimate proportionate to the standard error for an estimate of 300 is about 32. The factor of 1.2 times 32, or 38, means that the chances are approximately 2 out of 3 that the results of a complete count would not differ by more than 38 from the estimated 300. In table 25 for the State, however, the estimated number of dilapidated units was tabulated from the 100-percent count, and, therefore, is not subject to sampling variability.

Homeowner and rental vacancy rates, which are given in tables 1, 2, 3, 9, and 15 in the United States Summary chapter and in

TABLE IV.—FACTOR TO BE APPLIED TO TABLES II AND III

¹ Tables 40 to 42 in the State chapters.² When tabulated by ethnic group, the factor is somewhat larger.³ For the category "1 unit" in structure, use the factor 1.8.

tables 1, 2, 12, 18, and 22 in the State chapters, are subject to relatively small sampling variability in most cases since they are computed by using the 100-percent count of vacant units and the estimates of owner-occupied and renter-occupied units.

For a characteristic tabulated by color or tenure, the factor for the characteristic in table IV approximates the factor that applies to the data in the cross-tabulation. For example, to obtain the approximate standard error of the estimated number of owner-occupied units built in the period 1950 to 1954, apply the factor in table IV for "year structure built" to the estimate in table II.

In the text tables in the United States Summary chapter, 1950 data based on a sample also are subject to sampling variability. Estimates of the standard errors are given in *1950 Census of Housing*, Volume I, *General Characteristics*.

Standard error of differences.—The standard errors estimated from tables II and III (using factors from table IV) are not directly applicable to differences between two estimates. The estimates of sampling errors are to be applied differently in the following three situations:

1. For a difference between a sample estimate and one based on a complete count (e.g., a difference arising from comparison between condition and plumbing facilities based on the 25-percent sample for one area, and condition and plumbing facilities from the 100-percent tabulations in another area), the standard error of the difference is identical with the standard error of the estimate based on the sample.

2. For a difference between two sample estimates (e.g., one from 1960 and the other from 1950, or both from the same census year), the standard error is approximately the square root of the sum of the squares of the standard error of each estimate considered separately. This formula will represent the standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

3. For a difference between two sample estimates one of which represents a subclass of the other (e.g., units in sound condition and having all plumbing facilities as a subclass of all units in sound condition), the difference should be considered as the sample estimate; the standard error of this difference may be obtained directly.

CORRECTIONS

For the State chapters of Volume I, the portion consisting of the detailed tables has been prepared by assembling the materials originally issued in the separate HC(1) final State reports; for the United States Summary chapter, data tabulated for the State reports were used to compile the summary statistics. This plan was adopted to conserve public funds. The corrections in the distributions below would ordinarily have been made in the separate chapters if the detailed tables had been reprinted.

The corrections apply to the data on gross rent for housing units with nonwhite household heads, white heads of Spanish surname, and Puerto Rican heads. In both the State and the United States Summary chapters of Volume I, the gross rent distributions shown for these units erroneously include data for farm housing units; analysis reveals that for virtually all areas the great majority of these farm units were tabulated in the "no cash rent" category. Furthermore, each monthly gross rent of \$200 or more was erroneously edited as "not reported" and was assigned the rent of the preceding unit; it has been determined that the number of units involved in this error is relatively small.

Corrected distributions for some of the areas published in Volume I are available from the tabulations for Volume II of the 1960 Housing reports. Only those areas for which Volume II data are available are listed below. In addition to some individual SMSA's and places, corrected gross rent data from the Volume II tabulations are not available for States (divisions, regions, and the United States) by urban and rural residence and by location in and out of central cities.

Distributions are presented in section 1 for units with nonwhite household heads, in section 2 for units with white household heads of Spanish surname, and in section 3 for units with Puerto Rican heads. As is evident, the Volume II distributions were tabulated on the basis of fewer intervals than Volume I, affecting the lower and upper ends of the distribution. Medians are not shown because those computed from the corrected data show no change in most cases and very little in others, compared with the median gross rents presented in the Volume I tables.

It should be noted that the gross rent data in the census tract reports (Series PHC(1) reports) are not subject to the gross rent errors identified in Volume I of the 1960 Housing reports.

Table 22.—SELECTED CHARACTERISTICS OF HOUSING UNITS WITH NONWHITE HOUSEHOLD HEADS, FOR THE UNITED STATES,
By REGIONS, DIVISIONS, AND STATES: 1960

[Based on sample; see text. Data shown for areas having 400 or more housing units with nonwhite household heads. Median not shown where base is less than 200; minus (—) after number indicates median below that number]

Area	Total occupied units	Median number of rooms	Median number of persons	Percent of all occupied—							Owner value (dollars)	Renter Median gross rent (dollars)
				In one-housing unit structures	In structures built 1950-1960	Sound, with all plumbing facilities	With 1.01 or more persons per room	Moved in during 1958-1960	Owner occupied	Renter occupied

EXAMPLE OF ADVANCE CENSUS REPORT, FORM 60PH-6

(Form 60PH-6 was used by the householder for the 100-percent items in areas for which statistics are published by blocks. Form 60PH-5 was used in the rest of the United States. The two forms are the same except that items H15 and H16 are omitted from Form 60PH-5. Forms 60PH-6 and 60PH-5 were used in both the single-stage and two-stage procedures. The forms used in New York State contained additional questions on place of birth and citizenship.)

SECTION A—In this section list:

- Everyone who usually lives here, whether related to you or not.
- All persons staying here who have no other home.

PLEASE BE SURE TO LIST—

- All members of your family living with you, including babies.
- All other relatives living here.
- Lodgers and boarders living here.
- Servants, hired hands, others not related to you who are living here.
- Any one else staying here but who has no other home.

ALSO LIST—

Persons who usually live here but who are away temporarily on business, on vacation, or in a general hospital.

DO NOT LIST—

- College students who are away at college (or who are here only on vacation).
- Persons stationed away from here in the Armed Forces.
- Persons away in institutions, such as a sanatorium, nursing home, home for the aged, mental hospital.

They will be counted there.

Section A Table:

Line No.	Names of persons living here on April 1, 1960, and those staying here who have no other home	What is the relationship of each person to the head of this household?	Male or Female (M or F)	Is this person— White Negro American Indian Japanese Chinese Filipino Hawaiian Port Hawaiian Alaskan Eskimo (etc.)?	When was this person born?	Is this person— Married Widowed Divorced Separated Single (never married)?	Line No.
	Head of household on first line Wife of head Unmarried children, oldest first Married children and their families Other relatives Others not related to head of household						
1	VERNON Alexander J	HEAD OF HOUSEHOLD	M	White	July 1918	Married	1
2	VERNON Estelle K	Wife	F	White	April 1925	Married	2
3	VERNON Marcia A	Daughter	F	White	June 1949		3
4	VERNON Alexander, Jr. J	Son	M	White	Jan. 1960		4
5	DRAPER Ralph H	Lodger	M	White	Oct. 1937	Single	5

SECTION B—NEXT: Please answer the questions in this section to help the Census Taker count your household correctly.

- Does more than one family live in this house?
Yes ☐ No ☒
- Is there anyone left out of Section A, because you were not sure whether he should be listed—for example, a new baby still in the hospital, or a lodger who also has another home?
Yes ☒ No ☐
If "Yes," write name(s) here: Wood, James T.
- Is there anyone listed in Section A who is away from home now?
Yes ☐ No ☒
If "Yes," write name(s) here:

SECTION C—List below all persons who were staying here overnight on Thursday, March 31, 1960, except those you have already listed in Section A. Give their home addresses so that the Census Bureau can make sure it counts these people.

Name of visitor (If there are more than 2 names use an additional sheet)	What is the relationship of this person to the head of the household where he usually lives?	Male or Female (M or F)	Is this person— White Negro Hispanic (etc.)?	When was this person born?	Is this person— Married Widowed Divorced Separated Single (never married)?	Home house number and street	Home city or town and postal zone	Home State	If visitor's home is in a rural area— Box No., Rural Route No., and full description of location	Is there anyone there to report this person?
(1)	(2)	(3)	(4)	(5) Month Year	(6)	(7)	(8)	(9)	(10)	(11) Yes No
Wood, James T.	Head	M	White	Aug. 1912	Widowed	Sandy Hook Rd.	Newberry	Conn.	Box 12, R.R. 4, on Sandy Hook Rd., one mile south of intersection with U.S. 1	☐ ☒

SECTION D—These questions are about the place where you and the people you listed in Section A live. They refer to your house or the part of the house which you occupy, or to the apartment, flat, or rooms in which you live.

- Do you have a kitchen or cooking equipment? (Check one)
For use of the people in your household only (those you listed in Section A) ☒
Shared with another household or no cooking equipment? ☐
- How many rooms are in your house or apartment? (Count a kitchen as a room but do not count bathrooms)
Number of rooms: 7
- Is there hot and cold running water in this house or building? (Check one)
Hot and cold running water inside the house or building ☒
Only cold running water inside ☐
Running water on property but not inside building ☐
No running water ☐
- Is there a flush toilet in this house or building? (Check one)
Yes, for the use of this household only ☒
Yes, but shared with another household ☐
No flush toilet for the use of this household ☐
- Is there a bathtub or shower in this house or building? (Check one)
Yes, for the use of this household only ☒
Yes, but shared with another household ☐
No bathtub or shower for the use of this household ☐
- Is the house, part of the house, or apartment in which you live:
Owned or being bought by you or someone else in your household? ☒
Rented for cash? ☐
Occupied without payment of cash rent? ☐
Answer question H15 and fill Section E
Answer question H16 and fill Section E
Skip to Section E

HOME OWNERS AND BUYERS PLEASE ANSWER THIS QUESTION

H15. About how much do you think this property would sell for on today's market? (Check one)

Under \$5,000	\$15,000 to \$17,400
\$5,000 to \$7,400	\$17,500 to \$19,900
\$7,500 to \$9,900	\$20,000 to \$24,900
\$10,000 to \$12,400	\$25,000 to \$34,900
\$12,500 to \$14,900	\$35,000 or more

RENTERS PLEASE ANSWER THIS QUESTION

H16. If you pay your rent by the month—

What is your monthly rent? \$ (Nearest dollar) .00

OR

If you pay your rent by the week or some other period of time—

What is your rent and what period does it cover?

\$ (Nearest dollar) .00 per (Week, year, etc.)

SECTION E—PLEASE FILL SECTION E

- Does anyone else live in this building or anywhere else on this property?
Yes ☐ No ☒
- As far as you know, are there any vacant apartments or vacant rooms for rent in this building or elsewhere on this property?
Yes ☐ No ☒

3. Name of person who filed this form: Alexander J. Vernon
4. Your address (House number, street, apt., or room): 204 Loran Av. Larchdale, Ohio
5. Your telephone No.: Maine 2-7296

SECTION F—FOR CENSUS TAKER'S USE ONLY

1. E.D. No.
2. Page No.
3. Housing data on ACR
a. ☐ Recorded as 1 HU.
b. ☐ Revised.

Fill Inside Page for Population Census

ADVANCE CENSUS REPORT FORM FOR THE 1960 CENSUS OF POPULATION AND HOUSING

U.S. DEPARTMENT OF COMMERCE
BUREAU OF THE CENSUS

Dear Householder:

This Government report form is for you to fill out before the Census Taker calls to take the 1960 Census of Population and Housing. The enclosed example will serve as a guide to help you put down the required answers for each member of your household.

If you will have the form ready for the Census Taker by April 1, you can help speed up the Census and reduce costs. In order to make the results more accurate, you are asked to consult other members of your household, if necessary, to get the dates of birth and other facts. Any visitors who stayed overnight in your home on Thursday, March 31, 1960 should be listed in Section C of the report.

As provided in the Constitution, the Census count will determine the number of seats in Congress to be apportioned to each State. The information which you give will also help Government and business in developing their plans, which may affect all of us.

In one out of every four homes, extra questions will be asked. That home is picked by chance, so that no one knows in advance whether it will be yours or your neighbor's. When the Census Taker comes, he will tell you if your household has been chosen.

The information that you are required to furnish is held confidential by law. Your Census report cannot be used for purposes of taxation, investigation, or regulation.

Sincerely yours,
Robert W. Burgess
ROBERT W. BURGESS, Director
Bureau of the Census

DO NOT MAIL—HAVE READY FOR CENSUS TAKER

CONFIDENTIAL—The Census is required by the United States Constitution and further authorized by 13 U.S.C. 5, 9, 141, 221-4. The law requires that the inquiries be answered completely and accurately, and guarantees that the information furnished will be accorded confidential treatment. The Census report cannot be used for purposes of taxation, investigation, or regulation.

FORM 60PH-6

Form 60PH-2 was used by the enumerator for the 100-percent items in areas for which statistics are published by blocks. Form 60PH-1 was used in the rest of the United States. The two forms are the same except that items H1 and H14 to 16 are omitted from Form 60PH-1. Forms 60PH-1 and 60PH-2 were used in both the single-stage and two-stage procedures. The forms used in New York State contained additional questions on place of birth and citizenship; and the forms used in Alaska and Hawaii contained additional categories in the question on color or race.)

[illegible]

HOUSING ITEMS FROM HOUSEHOLD QUESTIONNAIRES

(The illustration below combines the sample housing questions from Form 60PH-7 and Form 60PH-8, which were used only in the two-stage procedure. Form 60PH-8 was used in areas for which statistics are published by blocks and Form 60PH-7 was used in the rest of the United States. Items H17, H18, H31, H32, H40, H41, and H42 are omitted from Form 60PH-8; item H34 is omitted from Form 60PH-7. See *United States Censuses of Population and Housing, 1960: Principal Data-Collection Forms and Procedures* for a facsimile of each form.)

PLEASE NOTE: These housing questions begin with number H17 because the Census Taker has already obtained the answers to questions H1 to H16.																																									
H17 and H18. Is this house: On a city lot (or is this an apartment building)? ☒ Yes ☐ No OR On a place of less than 10 acres? ☐ Yes ☒ No OR On a place of 10 or more acres? ☐ Yes ☒ No OR On a place of 10 or more acres? ☐ Yes ☒ No OR On a place of 10 or more acres? ☐ Yes ☒ No	H19. How many bedrooms are in your house or apartment? Count rooms whose main use is as bedrooms even if they are occasionally used for other purposes. If you live in a one-room apartment without a separate bedroom, check "No bedroom." No bedroom ☐ 1 bedroom ☐ 2 bedrooms ☐ 3 bedrooms ☒ 4 bedrooms or more ☐																																								
H20. About when was this house originally built? In 1959 or 1960 ☐ 1955 to 1958 ☐ 1950 to 1954 ☐ 1940 to 1949 ☒ 1930 to 1939 ☐ 1929 or earlier ☐	H21. How is your house or apartment heated? Check ONLY the kind of heat you use the most. Heated by: Steam or hot water ☐ Warm air furnace with individual room registers ☒ Floor, wall, or pipeless furnace ☐ Built-in electric units ☐ Room heater(s) connected to chimney or flue ☐ Room heater(s) not connected to chimney or flue ☐ Other method—Write in: ☐ Not heated ☐																																								
H22. Here is a list of fuels. In the first column, check which one is used most for heating. In the second column, check the one used most for cooking. In the third column, check the fuel used most for heating water. (Check one in each column) <table border="1"> <thead> <tr> <th>Fuel</th> <th>Used most for heating</th> <th>Used most for cooking</th> <th>Used most for heating water</th> </tr> </thead> <tbody> <tr> <td>Coal or coke</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Wood</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Utility gas from underground</td> <td>☒</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Pipes serving the neighbor-hood</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Bottled, tank, or LP gas</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Electricity</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Fuel oil, kerosene, etc.</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>Other fuel</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> <tr> <td>No fuel used</td> <td>☐</td> <td>☐</td> <td>☐</td> </tr> </tbody> </table>	Fuel	Used most for heating	Used most for cooking	Used most for heating water	Coal or coke	☐	☐	☐	Wood	☐	☐	☐	Utility gas from underground	☒	☐	☐	Pipes serving the neighbor-hood	☐	☐	☐	Bottled, tank, or LP gas	☐	☐	☐	Electricity	☐	☐	☐	Fuel oil, kerosene, etc.	☐	☐	☐	Other fuel	☐	☐	☐	No fuel used	☐	☐	☐	H23. Do you have a clothes washing machine? Do not count machines shared with any other household in this building. Machine with wringer or separate spinner ☐ Automatic or semi-automatic machine ☒ Washer-dryer combination (single unit) ☐ No washing machine ☐
Fuel	Used most for heating	Used most for cooking	Used most for heating water																																						
Coal or coke	☐	☐	☐

(The illustration below combines the sample housing questions from Forms 60PH-3(5), 60PH-3(20), 60PH-4(5), and 60PH-4(20). These forms were used in both the single-stage and two-stage procedures. Form 60PH-4 was used in areas for which statistics are published by blocks and Form 60PH-3 was used in the rest of the United States. Items enumerated for the 5-percent sample of housing units appear on Forms 60PH-4(5) and 60PH-3(5); those enumerated for the 20-percent sample appear on Forms 60PH-4(20) and 60PH-3(20). Items H17, H18, H29 to 34, H36, and H42 are omitted from Form 60PH-4(5); items H17 to 19, H22 to 28, H31, H32, and H42 are omitted from Form 60PH-3(20). Items H19, H22 to 28, H34, and H36 are omitted from Form 60PH-3(5); and items H19, H22 to 28, H34, and H36 are omitted from Form 60PH-4(20). See *United States Census of Population and Housing, 1960: Principal Data-Collection Forms and Procedures* for a facsimile of each form.)

[illegible]

EXCERPTS FROM ENUMERATOR'S REFERENCE MANUALS

The following paragraphs on concepts, definitions, and enumeration procedures for selected items are excerpts from the Enumerator's Reference Manuals used in the 1960 U.S. Censuses of Population and Housing. The paragraphs were taken from Manual F-200, which was used in the two-stage procedure. Concepts and definitions for the single-stage procedure are identical with those for the two-stage procedure, although instructions on the method of enumeration necessarily differ. Instructions for items not covered below are given in Manuals F-200 and F-200A for the two-stage procedure, or in Manual F-210 for the single-stage procedure.

DEFINITIONS FOR LIVING QUARTERS

7. Two Kinds of Living Quarters

Although the 1960 Census of Population and Housing divides all living quarters—places where people live—into housing units and group quarters, the housing portion of the census calls only for detailed information about housing units. People who live in group quarters are counted in the census, but their living arrangements are not described in the housing census statistics. The difference between these two categories is outlined below:

a. Housing units are found in private homes, apartment buildings, trailers, and other places where separate living arrangements exist.

b. Group quarters are found in institutions, dormitories, barracks, and other places where people do not have separate living arrangements. Group quarters are defined and described in paragraphs 161 and 162.

8. Housing Unit Defined

Except as noted in paragraph 13, a housing unit is usually a group of rooms or a single room occupied as separate living quarters by a family. However, a housing unit may also be occupied by a group of unrelated persons living together or by a person living alone. Vacant living quarters which are intended for occupancy as separate quarters are also housing units.

9. Separate Living Quarters Defined

A housing unit is separate when its occupants do not live and eat with any other household and when there is either—

a. Direct access from the outside or through a common hall, or

b. A kitchen or cooking equipment for the exclusive use of the occupants.

10. Types of Access

a. Direct from outside or common hall—There are two kinds of direct access included in this category:

- (1) Direct access from the outside—An entrance to the housing unit directly from the outside of the structure.
- (2) Direct access through a common hall—An entrance to the housing unit from a hall, lobby, or vestibule used by the occupants of more than one unit. The hall, lobby, or vestibule is not part of any unit but is clearly separate from all units in the structure.

b. Access through another unit—The only entrance to the unit is through a room or a hall of another unit.

11. Kitchen or Cooking Equipment Defined

a. A kitchen is a room primarily used for cooking and the preparation of meals.

b. A unit has cooking equipment when it has either—

- (1) A range or stove whether or not it is used regularly, or

- (2) Other equipment such as hotplate or electrical appliances if the equipment is used for the regular preparation of meals.

(See par. 40 for additional definitions of kitchen or cooking equipment for vacant units.)

12. "Exclusive Use" of Kitchen or Cooking Equipment Defined

Kitchen or cooking equipment is for exclusive use when it is used only by occupants of one housing unit. The occupants of a housing unit need not all be related. If they live and eat together, sharing common space and facilities, their quarters constitute one housing unit. When there is only one housing unit in the structure, a kitchen located in it is always for exclusive use.

13. Exceptions to Housing Unit Definition

a. If a room or group of rooms is occupied by five or more persons unrelated to the head of the household or to the person in charge, it is not considered a housing unit. It is called group quarters.

b. Do not enumerate trailers, tents, boats, or railroad cars if they are—

- (1) Vacant;
- (2) Used only for business;
- (3) Used only occasionally for extra sleeping space or vacations.

14. Examples of Housing Units

Usually a housing unit is a house, apartment, or flat. Sometimes it is a trailer or a hotel room. However, a structure intended primarily for business or other nonresidential use may also contain a housing unit; for example, the rooms in a warehouse where a watchman lives or the quarters of a merchant in back of his shop. A railroad car, houseboat, or other unusual place is also to be classified as a housing unit if it is occupied. Here are examples of living arrangements of the occupants of housing units:

a. A single family or a person living alone—A house, apartment, or flat occupied entirely by a single family or a person living alone is one housing unit.

b. Two or more families—A house, apartment, or flat occupied by two or more families who live and eat together constitutes one housing unit.

c. Groups of unrelated people—A house, apartment, or flat containing four or fewer persons, unrelated to the head of the household but who live together in family style, is one housing unit.

d. Families plus friends or lodgers—A house, apartment, or flat with four or fewer unrelated persons, living with a family and sharing its living arrangements, is one housing unit.

15. Examples of Borderline Housing Unit Classification Problems

The large majority of cases will be similar to the examples given in paragraph 14; it will be easy to identify and classify housing units. However, the following examples show that similar situations might be differently classified if they are borderline cases:—

a. A family rents one upstairs bedroom to two lodgers. The lodgers share the living room with the family and go through it to reach their bedroom. They do not prepare meals in their room. This house is classified as one housing unit since all of its occupants share the living space (fig. 1).

Figure 1.—One housing unit occupied by family and two lodgers.

b. If there were six lodgers instead of only two and the remaining facts about the living space remained the same, it would not be classified as a housing unit but as group quarters (see par. 162 and fig. 2).

Figure 2.—Group quarters occupied by family and six lodgers.

c. If the lodgers did not share the living room of the family and did not go through it to reach their rooms, but instead had direct access to their rooms through a common hall, they would be enumerated separately from the family. The space occupied by the family group would be one housing unit and the space occupied by each of the lodgers who had direct access to his room would be enumerated as a separate housing unit (fig. 3).

Figure 3.—Four housing units: One occupied by family and three occupied by lodgers who live separately and have separate access to their rooms.

16. Guides in Applying the Housing Unit Definition

Here are a few common rules to follow in the determination of what constitutes a housing unit:

a. Base your decisions on the living arrangements of the occupants and not on their relationships.—For example, three unrelated girls may rent an apartment and keep house together. Their apartment is one housing unit. On the other hand, two related couples, a man and wife and his parents, may occupy a house and have separate quarters in it. If they do, they live in two separate housing units.

b. Consider the way houses and apartments are used rather than the way they are built.—In cities, particularly overcrowded sections, large apartments may be rented out room by room, and a whole family or even families may occupy one or two rooms. Each such separately rented space may constitute a separate housing unit. On the other hand, a two-family house with two kitchens occasionally is occupied by a single family which uses all the rooms and cooks and eats together. This house should be enumerated as one housing unit.

c. Apply the census criteria for separateness (direct access and kitchen or cooking equipment for exclusive use) only when people say they live separately.—If people report that they live and eat together as a family group, no further inquiries need to be made to determine separateness.

HOW TO DETERMINE "USUAL RESIDENCE"

19. Usual Place of Residence

Usual place of residence is, ordinarily, the place a person regards as his home. As a rule, it will be the place where he usually sleeps.

20. General Rules for Enumerating Persons in Each Housing Unit

Include the following persons in each housing unit:

- Members of the household living at home.
- Members of the household temporarily absent on vacation, visiting, or on business.
- Members of the household who are in a hospital but who are expected to return shortly.
- Newborn babies, born before April 1, who have not yet left the hospital.
- Boarders or lodgers who regularly sleep in the housing unit.

26. Persons Temporarily Absent From Home Who Are Considered Usual Residents

Enumerate as usual residents at their homes the following:

- Persons temporarily absent from home, visiting friends or relatives, on vacation, or abroad.
- Persons temporarily absent "on the road" in connection with their jobs—persons on business trips, traveling salesmen, railroad men.
- Persons temporarily absent from home in general hospitals or other hospitals where patients usually stay only for a short period.

31. Persons With More Than One Residence

a. Persons who work away from home most of the week but come home for weekends should be enumerated as residents of the unit where they live most of the week.

b. A few persons may have several homes—for example, a winter home in Florida, an apartment in New York City, and a summer home in Maine—each of which could be usual residence. In such a case, the usual residence is the place in which the person spends the largest part of the calendar year; he should be enumerated there. Note, however, that persons who spend the year moving from one resort hotel to another with the seasons have no usual place of residence and are therefore enumerated where found.

34. Persons With No Usual Residence

Enumerate as residents of your ED all persons who have no other residence or fixed address. For example, a man who has given up his room in a nearby city and is staying in your ED for a few days before continuing his journey to another State is a person with no usual place of residence. Persons in railroad, highway and other construction camps, convict camps, camps for migratory agricultural workers, one-night lodgings, or other places that have shifting populations composed mainly of persons with no fixed place of residence, should be enumerated where they are staying on the date of enumeration.

35. Persons With Usual Residence Elsewhere

Usual residence elsewhere means a definite house, apartment, hotel room or suite, or other living quarters held for a person and immediately available to him on his return. In addition to guests, persons with a usual residence elsewhere will include college students temporarily home on vacation, members of the Armed Forces stationed elsewhere but home on leave, inmates temporarily absent from institutions and persons who live and work most of the week in another area. Persons who claim a usual residence elsewhere and who were staying in your ED on the night of March 31 should be reported on Individual Census Reports if there is no one at home to report for them (see pars. 155 to 160).

VACANT HOUSING UNITS

37. Vacant Housing Units Defined

The definition of housing units (see par. 8) specifically states that vacant units "which are intended for occupancy as separate quarters are also housing units." The rules about separateness and the criteria of separateness apply to vacant as well as to occupied housing units.

38. Characteristics of Vacant Housing Units

A housing unit is vacant if no persons are living in it at the time of enumeration. However, if the occupants are only temporarily absent, consider the unit as occupied. A vacant unit may be furnished or unfurnished; it may be for rent or for sale; it may already have been rented or sold, but the new occupants have not moved in; or, it may be vacant because the owner is holding it—either for occasional or future use, for speculation, or for other reasons, such as waiting for the settlement of an estate.

39. General Rules for Identifying Vacant Housing Units

The final determination of whether occupied living space is a housing unit is made on the basis of the living arrangements of the occupants (see par. 16). In vacant housing units, the living arrangements of intended occupants are to be considered. To determine whether specific vacant space is a housing unit, and later to determine what facilities are available to its intended occupants, follow these rules:

- Ask about the present layout and equipment.
- If necessary, clarify the present situation by asking what the expected living arrangements of the intended occupants will be.
- When no other information is available, assume the arrangements of the intended occupants will be the same as those of the previous occupants.

40. Kitchen or Cooking Equipment for Vacant Units

Following the general rule in the preceding paragraph, the determination of whether a kitchen or cooking equipment is available may be made in this fashion:

a. First, determine whether or not there is a kitchen. If there is one, find out whether it is for the exclusive use of the intended occupants or whether it is to be shared.

b. If there is no kitchen in the unit, find out whether there is cooking equipment for the exclusive use of intended occupants.

c. If there is no cooking equipment present at the time of enumeration, but you learn that the last occupants had such equipment, consider the unit as having cooking equipment.

41. Rules for Enumerating Vacant Housing Units

As you enumerate, some housing units will be vacant because they are being newly built or altered, torn down, etc. The general rule is to enumerate units as they exist at the moment of enumeration. The specific rules appear in the following paragraphs:

a. Vacant, under construction—Enumerate a housing unit being newly constructed if all the exterior windows and doors are installed and the final usable floors are in place. If construction has not reached this point, do not consider the space as living quarters and do not enumerate it.

b. Vacant, being converted or merged—Conversion is the creation of two or more housing units from fewer units through structural alteration or change in use. For example, one unit may be divided into two units or three units. Merger is the combining of two or more housing units into fewer units through structural alteration or change in use. For example, two apartments may be combined into one. If the change has just started at the time of enumeration, enumerate the number of units which existed before the start of the conversion or merger. However, if the changed units can be identified, enumerate those which have been created by the conversion or merger.

c. Vacant, being used for nonresidential purposes—If the unit is being used for commercial or business purposes, or if it is used for the storage of hay, machinery, business supplies, and the like, do not consider the unit as living quarters and do not enumerate it. However, storage of excess house furniture is not to be considered in the same nonresidential classification as storage of hay, machinery, etc. Vacant units in which excess house furniture is stored should, therefore, be enumerated.

d. Vacant, to be used for nonresidential purposes—If the vacant unit is to be used for nonresidential purposes in the future, but no change or alteration has taken place as yet, consider the unit as living quarters and enumerate it. However, if the change or alteration has started, do not enumerate the unit.

e. Vacant, dilapidated—Enumerate vacant units even though they are dilapidated, provided they are still usable as living quarters.

f. Vacant, unfit for human habitation—If through deterioration or vandalism, most of the doors and windows of the unit are missing and the floors are unsafe, consider the unit as unfit for human habitation and do not enumerate it. In cases where the unit is condemned, see par. 41i. If doors and windows have been boarded up to keep them from being destroyed, they are not to be considered as missing.

g. Vacant, being demolished—If the unit is actually being demolished, do not enumerate it.

h. Vacant, to be demolished—If there is positive evidence (a sign, notice, or mark on the house or in the block) that the unit is to be demolished, do not enumerate it. If there is no such evidence, consider the unit as living quarters and enumerate it, unless it is unfit for human habitation (see par. 41f).

i. Vacant, condemned—If there is positive evidence (a sign, notice, or mark on the house or in the block) that the unit is condemned for reasons of health or safety and that further occupancy is prohibited, do not enumerate it. If there is no such evidence, consider the unit as living quarters and enumerate it, unless it is unfit for human habitation (see par. 41f).

j. Vacant, abandoned—If a unit has been abandoned, enumerate it unless it is unfit for human habitation, being demolished, or condemned.

42. How To Obtain Information About Vacant Units

Obtain the information from the most reliable source available—owner, owner's agent, resident or building manager, real estate company, caretaker, or neighbor.

43. Procedure for Discovering Vacant Units

To insure that all vacant units will be included in the census, you will have to look for and inquire about them in many kinds of places. Step eight of the nine steps to be followed in enumeration (see pars. 78 and 94) will help you to locate vacant units. When you are enumerating in multi-unit structures, in houses that have been converted into apartments, or at addresses where there are other structures on the property, ask specifically about vacant units which may be in the basement, in the attic, over the garage, in the rear, or in another structure on the property or on adjoining property.

HOW TO CANVASS AND LIST YOUR ED

56. Why the Listing Book Is Used

Your Listing Book has three main purposes—to keep a record of units found during your canvass, to select the sample units, and to record all the work you do as an enumerator. In this book you will enter the address of the unit (including map block number, if any), the sample key letter, name of head of household or other description of the unit, and the number of the FOSDIC schedule page on which the unit is enumerated. In addition, the Listing Book will serve as a record of callbacks to be made, a record of completed visits, and a record of the number of persons enumerated in each unit. Detailed and specific instructions for all entries in the Listing Book are given in that book.

HOW TO CONDUCT THE INTERVIEW WHEN THE ADVANCE CENSUS REPORT IS FILLED OUT

61. Check Information on Advance Census Report

When the Advance Census Report (ACR) is filled out before the interview, transfer the information from it to your FOSDIC book while you are in the respondent's home. Before transferring it, find out—

- Whether the people whose names are listed on the report occupy one and only one housing unit, and
- Whether the list of persons on the Advance Census Report is complete. Of course, if you find more than one unit, you should list the occupants of the units separately and correct the housing information so that it applies to the proper unit. And, if you learn that anyone else lives in the unit, you should complete the list of persons.

62. Special FOSDIC Instructions

Across the top of the FOSDIC schedule are printed instructions for specific steps—nine of them—to be taken to obtain and record the required information. If the Advance Census Report is filled out, follow the instructions for the nine steps shown in italics on the FOSDIC schedule. The paragraphs below explain these steps.

63. Sample Key and Address

You have assigned a sample key letter A, B, C, or D to each unit in your Listing Book. Copy the key letter you assigned to the unit from column (5) in the Listing Book into items P1 and H1 of the FOSDIC schedule. Copy the address from columns (1), (3), and (4) in the Listing Book into item H2.

64. Question B1. "Does more than one family live in this home?"

This is the first question of Section B of the Advance Census Report. It is asked to be sure that each housing unit is enumerated separately and correctly. An answer of "No" to this question probably means that all the people listed on the Advance Census Report should be enumerated as occupying the same housing unit. But, when the answer is "Yes," there should be an entry for the next question on the Advance Census Report "Do they live and eat with your family?" Note the arrow on the form which instructs people when to answer this second question.

65. Application of the Rules for Separating Housing Units

After you apply the rules given in paragraphs 8 to 13, determine how many housing units there are as follows:

a. Family connections not a consideration. If the answer to the question "Do they live and eat with your family?" is "Yes," the people occupy one housing unit. People who live and eat together occupy just one housing unit, regardless of family connections.

b. Two conditions determine "separateness." Each separate housing unit should be listed and enumerated. An answer of "No" to the question "Do they live and eat with your family?" requires additional questions to determine whether separateness exists. If people are reported as living and eating separately, the space they occupy constitutes a separate housing unit provided it has either:

- (1) Direct access from the outside or through a common hall, or
- (2) A kitchen or cooking equipment which is not shared with the occupants of any other housing unit.

c. Verifying "separateness." If persons are reported as living and eating separately but the space they occupy does not have direct access or separate cooking equipment, they do not occupy separate housing units. When there is neither direct access nor cooking equipment for exclusive use, consider the space occupied by both groups as a single housing unit, even when the "No" box is checked on the Advance Census Report. Follow this rule even when the two families have already been listed on separate Advance Census Reports.

66. Example of Housing Unit With Lodger

An example of a situation in which only one housing unit exists but the "No" reply could be given to the question "Do they live and eat with your family?" follows. A lodger takes his meals out. He does not eat with the family who rents him a room and they do not consider that he lives with them. But he has to go through the family living room to reach his room. Having neither direct access nor cooking facilities, his room is not a separate housing unit. It is part of and should be combined with the unit of the landlord, and the lodger should be enumerated in the landlord's household.

73. Housing Items H5 to H16 (Section D)

Before you copy the information from the ACR to your FOSDIC book make sure that it refers to the housing unit in which the people you have just listed are living. For example, if the respondent reported the information for his entire home, but you find that he has a vacant apartment for rent on the second floor, the vacant apartment should be listed as a separate housing unit. Make the necessary corrections for the original unit before recording the information on the FOSDIC schedule. For example, correct number of rooms (H8) and any other items that might need correction. Corrections would also be needed if two Advance Census Reports are filled out for living quarters that constitute only one housing unit. For example, one report is filled out for the landlord's quarters and one for a lodger who does not have a separate unit. The information for both should be combined on the FOSDIC schedule so that the lodger is listed as a nonrelative in the landlord's housing unit, and, therefore, only one housing line is filled.

74. Items Not Shown on Advance Census Report

The following housing questions which appear on one or both of the FOSDIC schedules, but are omitted from the Advance Census Report, are to be marked on the basis of your observation: Type of housing unit (H3), Access to unit (H4), and Condition (H6). Description of property (H14) appears only on the PH-2 schedule. Occupancy (H7) and vacancy status (H13) are to be marked on the basis of observation and by questioning neighbors, real estate agents, or other reliable respondents.

78. Check for Other Units

After transferring the housing items to the FOSDIC schedule, check to see if there are any other units on this property that must be visited. The householder is asked to fill out items E1 "Does anyone else live in this building or anywhere else on this property?" and E2 "As far as you know, are there any vacant apartments or vacant rooms for rent in this building or elsewhere on this property?" Whenever either one of these questions is answered "Yes," you will know that you have more units to enumerate here. Ask about the specific location of these quarters. The first question will be helpful in houses that have been converted to apartments or at addresses where there are hard-to-find living quarters in the basement, attic, or in the rear. The second question should be asked to be sure that all vacant housing units are enumerated.

81. Ask About Next Unit—Ninth Step (1st Part) FOSDIC Schedule

Make inquiries at each unit about the next unit. Ask for the name of the head, the number of persons, and the best time to find someone at home. Then, if no one is at home at the next unit, you will have the information necessary for your callback record. After reviewing your scheduled callbacks, enter the best time to call in column (8) of the Listing Book. (See par. 121 for additional instructions.)

82. Vacant Unit—Ninth Step (2d Part) FOSDIC Schedule

Try to find out the name of the proper person from whom to obtain information about a vacant unit. The name and telephone number of the person who furnishes information for the unit should be noted in column (19), "Remarks," of your Listing Book.

HOW TO CONDUCT THE INTERVIEW WHEN THE ADVANCE CENSUS REPORT IS NOT FILLED OUT

83. General Methods

When the Advance Census Report has not been filled out, you will have to obtain the information for the FOSDIC schedule by questioning the respondent. Sometimes you may be given an Advance Census Report which is filled out so inadequately that you will find it easier to ignore it and conduct the interview entirely from the FOSDIC schedule.

84. Special FOSDIC Instructions

Across the top of the FOSDIC schedule there are instructions for nine specific steps to be taken to obtain and record the required information. If the Advance Census Report (ACR) is not filled out, follow the instructions for the nine steps shown in heavy type on the FOSDIC form. The paragraphs below explain these steps.

85. Sample Key and Address (First Step)

You have assigned a sample key letter, A, B, C, or D, to each unit in your Listing Book. Copy the key letter you assigned to the unit from column (5) in the Listing Book to items P1 and H1 of the FOSDIC schedule. Copy the address from columns (1), (3), and (4) in the Listing Book to item H2. This is the first of the nine steps on the FOSDIC schedule.

86. How To Identify Housing Units (Second Step) "Does more than 1 family live in this home?"

There are two questions printed on the FOSDIC schedule for the second step. An answer of "No" to first question, asked to be sure that each housing unit is enumerated separately and correctly, probably means that there is only one housing unit in the house or apartment you are enumerating. But, when the answer to the first question is "Yes," ask "Do they live and eat with the family, or do they have separate quarters?"

87. Application of the Rules for Separating Housing Units

After you apply the rules given in paragraphs 8 through 13, determine how many housing units there are as follows:

a. Family connections not a consideration. If the answer to the second question (par. 86) indicates that one or more persons live and eat with the family, everyone in the house or apartment should be enumerated as occupying one housing unit. People who live and eat together occupy a single housing unit, regardless of family connections. The space occupied by second families, lodgers, or other nonrelated persons is part of the common single housing unit.

b. Two conditions determine "separateness." Each separate housing unit should be listed and enumerated. If the answer to the second question is that persons have separate quarters, additional questions should be asked to determine whether these quarters are separate according to census definition. When persons are reported as living and eating separately, the space they occupy constitutes a separate housing unit provided it has either:

- (1) Direct access from the outside or through a common hall, or
- (2) A kitchen or cooking equipment which is not shared with the occupants of any other housing unit.

c. Verifying "separateness." If the answer to the second question is that persons have separate quarters but these quarters have neither direct access nor separate cooking equipment, they do not occupy a separate housing unit. When there is neither direct access nor cooking equipment for exclusive use, consider the space occupied by the two families or one family and lodgers (less than five) as a single housing unit.

88. An Example of a Housing Unit With Lodgers

Here is an example of a situation in which only one housing unit exists but a respondent could report that more than one family lives in his home and occupies separate quarters: A lodger does not eat with the family who rents him a room and they do not consider that he lives with them. His landlord says that there is more than one family and that the lodger has separate quarters. But the lodger has to go through the family's living room to reach his room. He has no cooking equipment in his room but takes his meals out. Having neither direct access nor cooking facilities, his room is not a separate housing unit. His room is part of the landlord's unit and he should be enumerated in the landlord's household.

93. Seventh Step—Items H3 to H5.

Mark the appropriate circles in the housing items at the bottom of the page except when you are enumerating group quarters. Use the appropriate word "house," "apartment," or "rooms," instead of the word "unit" in the questions that have been specified for you to ask.

94. Eighth Step—Check for Other Units

After completing the housing items for the unit, you should check to see whether there are any other units on this property that must be visited. Ask "Does anyone else live in this building or elsewhere on this property?" and then ask "Are there any vacant apartments or any vacant rooms for rent?" Whenever the answer to either one of these questions is "Yes," you will know that you have more units to enumerate here. Ask about the specific location of these quarters. The first question will be helpful in houses that have been converted into apartments, or at addresses where there are hard-to-find living quarters in the basement, attic, or in the rear. The second question should be asked to make sure that all vacant housing units are enumerated.

95. Ninth Step (1st Part)—Ask About Next Unit

Make inquiries at each unit about the next unit. Ask for the name of the head, the number of persons, and the best time to find someone at home. Then, if no one is at home at the next unit, you will have the information necessary for your callback record. After reviewing your scheduled callbacks, enter the best time to call in column (8) of the Listing Book. (See par. 121 for additional instructions.)

96. Ninth Step (2d Part)—Vacant Unit

Try to find out the name of the proper person from whom to obtain information about a vacant unit. The name and telephone number of the person who furnishes information for the unit should be noted in column (19), "Remarks," of your Listing Book.

HOW TO ENTER THE INFORMATION ON THE FOSDIC SCHEDULE

97. Organization of the FOSDIC Schedule

The permanent record of the 1960 Census of Population and Housing is the information contained on the FOSDIC schedule. The front and back pages of each schedule are divided into three sections:

a. Heading—This section has space for recording the block number (schedule PH-2 only) and the page number. Do not assign a page number to any page on which no population or housing or block number entries are made. A page number should be assigned to a page on which a block number for "no population" blocks has been entered.

b. Population—This section has space for recording as many as 20 people. You will not enumerate that many people on a single page very often because of the rules for using the FOSDIC schedules. (See par. 118.)

c. Housing—This section has space for as many as four housing units. Again, because of the rules for using the FOSDIC schedules, you will not always be able to enumerate four housing units on a single page.

HOW TO DESIGNATE SAMPLE HOUSING UNITS

143. Selecting Sample Housing Units

You will help prepare for Stage II of the census by leaving the Household Questionnaires and the Individual Questionnaires at the right places and for the right persons. The following procedure will tell you which are the right places and persons:

a. Use the "Sample Key Start Letter"—Item 2 on the cover of the Listing Book for your assignment will show your "Start Letter." This is the letter, A, B, C, or D, which you are to enter in column (5) of the Listing Book for the first housing unit you list.

b. Assign sample key letters—The "Start Letter" is your first sample key letter and you will assign it to the first housing unit. You will enter a sample key letter in column (5) of your Listing Book for every housing unit in your assignment. You will use the four sample key letters, A, B, C, D, in alphabetical sequence. Start over again with "A" after reaching the letter "D."

151. Duties at Occupied "A" (Sample) Housing Units

a. Your first duty is to complete the enumeration of the unit on the FOSDIC schedule.

b. After that, you are to tell the respondent that additional information is needed for his household and request him to fill out and mail the Household Questionnaire to the Census District Office within three days.

c. Then, enter on the Household Questionnaire the names of all the persons enumerated in the sample unit. Use a separate population section for each person. Since only four names can be entered on one questionnaire, you will have to prepare and leave Individual Questionnaires wherever you enumerate five or more persons.

d. Enter the ED number and the page number of the FOSDIC schedule on which the unit is enumerated in the enumerator's block on the back of the questionnaire, and also on the preaddressed envelope.

152. Duties at Vacant Sample Housing Unit

At a vacant sample unit, collect only the housing information for the FOSDIC schedule, according to

your instructions, but do not leave a Household Questionnaire. Be sure to enter in the Listing Book the name and telephone number of the person or real estate company who gave you the information about the unit.

153. Duties at a Sample Unit Occupied Entirely by Nonresidents

Treat the unit in the same way you would a vacant unit. Remember to fill out ICR's for all persons who say that there is no one to report for them at their homes or who do not know if they will be reported.

ENUMERATION OF GROUP QUARTERS

161. Where Group Quarters Are Found

In addition to the private living quarters called "housing units," there are other types of places where people live, such as institutions, barracks, hotels, tourist courts, military installations, etc. Some of the occupants of these places will have separate "housing units," but most of them will live in quarters that cannot be divided into individual "housing units." For the census, such places are called "group quarters."

162. Group Quarters Defined

Group quarters are living arrangements for institutional inmates and for groups of five or more persons unrelated to the head of the household or the person in charge. They are found most frequently in institutions, hospitals, nurses' homes, and large lodging or boarding houses (see list in appendix A). A common type of group quarters is a house in which five or more lodgers or boarders share with a family and use together such rooms as the living room and the dining room. Still another example is an apartment shared by six unrelated individuals, one of whom must be designated as head of the household.

164. Classifying Group Quarters and Housing Units in Group Quarters

Sometimes staff or supervisory personnel of institutions, hospitals, military installations, resident schools, etc., occupy separate living quarters that meet the rules for separate "housing units." These quarters are to be enumerated as separate housing units. Inmates, patients, or other persons who are neither staff nor supervisory personnel by definition occupy group quarters and never housing units.

165. Lodging or Rooming Houses

Houses or apartments containing five or more people unrelated to the person in charge may or may not be enumerated as group quarters depending upon the living arrangements of the occupants. For example, lodgers may share rooms in the house with the operating family so that it is impossible to tell where the operating family's quarters end and the lodger's quarters begin. In such a case, the entire house or apartment should be classified as group quarters unless there are living quarters which can be separately identified.

167. How To Record Housing Units Located in Places With Group Quarters

All housing units for staff members and other supervisory personnel should be listed in the same manner as other housing units and assigned sample key letters A, B, C, or D. Such housing units should be listed before the listing of the group quarters for inmates, students, etc.

168. How To Fill the FOSDIC Schedule in Group Quarters

a. Housing units, if any, first. Enumerate the staff members and other supervisory personnel first, together with their families, and fill a housing line for each housing unit. Follow the usual procedures outlined in the nine steps at the top of the FOSDIC schedule.

169. Summary Instructions for Enumerating Various Types of Group Quarters

The following outline summarizes the procedure for identifying the various types of group quarters. Appendixes A and B give more detailed instructions on enumeration procedures in institutions and hospitals.

Type of Place	Instructions
a. Institutions: Prisons, jails, reformatories; homes for aged, poor, or incurables; childrens' homes or orphanages; nursing or convalescent homes; mental or tubercular hospitals.	Most of the quarters in institutions will be group quarters. When you find completely separate housing units used as living quarters by the supervisory staff whether in buildings on the institutional grounds or in the buildings housing the inmates, list such separate quarters in the same manner as all other housing units, except that in addition to the address of the unit you also enter the name and type of the institution (orphanage, nursing home, etc.). Complete the population and housing items for each housing unit, marking "house, apartment, flat" in H3. Then combine all inmate quarters with the quarters occupied by resident staff members of the institution who do not live in housing units and list them on a single housing line as group quarters.
b. Rooming house, lodginghouse.	List as separate housing units any separate living quarters with occupants that live or eat separately from occupants of other units, provided such quarters have either direct access or cooking facilities for exclusive use. Treat as group quarters all shared living quarters containing five or more lodgers unrelated to the person in charge when the quarters of the individual lodgers do not meet the rules for separate housing units.
c. Boarding house, bunkhouse.	Treat as group quarters all boarding houses or bunkhouses with five or more boarders unrelated to the person in charge.
d. Convent, monastery.	A convent or monastery constitutes group quarters except for caretaker personnel with separate quarters.
e. Armed Forces installations, including Armed Forces hospitals and prisons.	List as housing units all of the separate living quarters in Armed Forces installations that meet the housing unit definition. Such quarters may be located in separate residential buildings, hospitals, officers' clubs, or buildings used partly for nonresidential purposes. Enumerate these housing units in the same manner as all other housing units. The quarters of all other occupants in Armed Forces installations are to be combined and listed on a single housing line and enumerated as group quarters, that is, all barracks, bachelor officers' quarters, base hospital wards, and transient quarters on the installation are to be combined on one line. See appendix C for detailed instructions for enumerating military personnel.

f. Dormitory or dormitory-type quarters (e.g., residence hall or club), sorority or fraternity house, nurses' home, general hospital, etc.

Most of the quarters of these types of places will be group quarters.

However, you may find some completely separate housing units used as living quarters by the supervisory staff in buildings containing group quarters, such as the apartment of the housemother in a college dormitory or the separate living arrangements of the manager of a mission shelter. List such separate quarters in the same manner as all other housing units.

Combine the quarters of all other occupants and list them on a single housing line as group quarters.

ENUMERATION OF HOTELS, MOTELS, LODGES, YMCA'S, ETC.

170. Responsibility for Enumerating Hotels and Motels

Large hotels, motels, and similar places having 50 or more rooms for rent to transients are enumerated by special enumerators. You will be told to skip these. For all other hotels, motels, etc., use the procedures outlined in the paragraphs that follow.

171. Procedure for Making Listing Book Entries

a. Write address and name of the hotel, motel, or similar place.

b. Determine from the manager or other responsible person—

(1) How many rooms or suites are in the hotel, motel, etc.

(2) How many rooms are occupied by "nontransients." "Nontransients" are persons whose usual place of residence is the hotel, motel, etc., or those who have no other usual place of residence. If the manager cannot determine which persons fulfill this definition, accept his understanding of "Nontransient."

c. If the number of rooms or suites occupied by "nontransients" is 75 percent or more of the total rooms or suites, consider the hotel as "nontransient."

(1) If the number occupied by "nontransients" is less than 75 percent of the total rooms or suites, consider the hotel as "transient."

172. Procedure for Enumeration of "Nontransient" Type Hotels, Motels, Etc.

a. Listing Book—List in your Listing Book every room or suite of rooms in the hotel, motel, etc., whether occupied or vacant. Each is a housing unit. List in order of room number.

d. Housing information—Fill out a housing line on the FOSDIC schedule for every room or suite of rooms in the hotel or motel. Obtain the information from the manager. You cannot complete the housing section until you know whether the unit is "occupied" or "vacant," according to the following rules:

(1) Occupied units—Fill the housing items specified for occupied units for each unit occupied by persons who are residents of the hotel, motel, etc.

(2) Vacant units—Fill the housing items specified for vacant units for each unoccupied unit and for each unit occupied by persons with usual residence elsewhere. Write "VAC" or "VAC-URE," as appropriate, for the vacant units in item P2.

e. Household Questionnaire—Leave a Household Questionnaire for each occupied unit (see above) having the sample letter "A." Leave an addressed envelope for each unit and arrange to have the management give these forms to the occupant of the sample unit. The sample housing questions for vacant units will be completed by the Stage II enumerator.

173. Procedure for Enumeration of "Transient" Type Hotels, Motels, Etc.

a. Listing Book—List in your Listing Book only those rooms or suites occupied by persons whom the manager regards as "nontransient." List in order of room number.

d. Housing information

(1) Fill a housing line on the FOSDIC schedule for each room or suite of rooms in the hotel or motel occupied by residents; that is, occupied by persons who usually live here or who have no usual residence elsewhere. Obtain the information from the manager.

(2) In your Listing Book you will have entered the rooms or suites occupied by persons the manager regarded as nontransients. You may discover that the occupants of some of these units are not residents. Conversely, you may discover that some of the rooms the manager regarded as occupied by transients are occupied by persons you will enumerate as residents. The housing units reported in your FOSDIC book must be only those occupied by persons who are residents. Cancel any rooms originally listed if you find they are not occupied by residents. Add any units not originally listed if you find the occupants are residents of this hotel. (See par. 134 for procedure to follow when additional units are found.) Cancellation or addition should be made in the Listing Book and on the FOSDIC schedule.

(3) Do not enumerate any unoccupied rooms or rooms occupied by persons with a usual residence elsewhere.

e. Leaving Sample Household Questionnaires—Leave a Household Questionnaire for each occupied unit having the sample key letter "A." Leave an addressed envelope for each unit and arrange with the management to transmit these forms to the occupant of the sample unit.

PROCEDURE IN SPECIAL SITUATIONS

174. Housing Units Temporarily Occupied by Persons With Usual Residence Elsewhere

Occasionally, you may find a housing unit temporarily occupied by persons all of whom have a usual residence elsewhere. An example is a beach cottage temporarily occupied by a family which has a usual place of residence in the city where they should be enumerated. The following procedure should be used:

a. Population items—Mark sample key letter in P1 and enter "VAC-URE" in P2. Make no further entries in the population items on the FOSDIC schedule.

b. Housing items—Fill out the housing items that you would fill for vacant units.

TRANSCRIPTION FROM YOUR FOSDIC BOOK TO THE SAMPLE FOSDIC BOOK

177. Preparing Sample Schedules for Stage II

Paragraphs 143 to 154 tell you how to prepare for the second stage of the census by designating the sample persons and housing units. In addition, you will have the job of preparing the sample FOSDIC schedule books for the Stage II enumerators. Your Crew Leader will give you a sample FOSDIC schedule book for each ED in your assignment. Your job is to copy all of the information for each sample housing unit and person from your Stage I FOSDIC schedule book to the sample Stage II FOSDIC book. This will be the first step in recording all the information required for sample persons and units on the same schedule.

180. What You Should Copy

You should copy to the Stage II FOSDIC book the housing and population information that you have entered in your Stage I FOSDIC book as follows:

a. For every housing unit to which you have assigned the sample key letter "A"—copy the housing-unit line and all population lines.

POPULATION ITEMS**201. Item P5. Color or Race**

Mark the appropriate circle for White, Negro, American Indian, Japanese, Chinese, or Filipino. If the person is of some other race, mark the circle "Other" and write in the specific entry, such as Korean, Hindu, Eskimo. Do not mark "Other" for persons reported as Mexicans, Portuguese, etc. (see par. 202). When information is not available on the Advance Census Report, you may assume the race of the related persons living in the unit is the same as that of the respondent, unless you learn otherwise. It may be necessary to ask the race of unrelated persons (employees, hired hands, lodgers, etc.)

202. Definitions for Color or Race

a. Puerto Ricans, Mexicans, and other persons of Latin-American descent—These are not racial descriptions. Mark "White" for such persons unless they are definitely of Negro, Indian, or other non-white race.

b. Italians, Portuguese, Poles, Syrians, Lebanese, and other European and Near Eastern nationalities—These are not racial descriptions; mark "White" for such persons.

c. Negroes—Mark "Negro" for Negroes and for persons of mixed white and Negro parentage. A person of mixed Indian and Negro blood should be marked "Negro," unless you know that the Indian blood very definitely predominates and that he is regarded in the community as an Indian.

d. American Indians—Mark "American Indian" for full-blooded Indians and for persons of mixed white and Indian blood if you know the proportion of Indian blood is one-fourth or more, or that they are regarded as Indian in the community where they live.

e. Indians—For persons originating in India (except those of European stock), mark "Other" and specify as "Hindu." If there is an entry of "Indian" on the Advance Census Report be sure you know whether the person is an American Indian or an Asian Indian.

203. Mixed Parentage

For persons of mixed white and nonwhite races, report race of nonwhite parent. Other mixtures of nonwhite races should be reported according to the race of the father. However, note exceptions in previous paragraphs.

HOUSING ITEMS**213. Definitions of Housing Terms**

In the instructions for the housing items, you will find several recurring terms or phrases that have special meanings as they are used in a census. The definitions of these terms are given in paragraphs 214 to 219.

214. Structure Defined

A structure is a separate building that either has open space on all four sides, or is separated from other structures by dividing walls that extend from ground to roof.

215. Detached and Attached Structures

A detached structure has open space on all four sides (figs. 14A through 14C). A one-unit structure is detached even if it has an adjoining shed or private garage. An attached structure has one or more vertical walls dividing it from other adjoining structures. In row houses, double houses, or houses attached to nonresidential structures, each house is a separate attached structure if the common wall between them goes from the ground to the roof (figs. 14D and 14E).

216. Inside and Outside the Structure

To be "inside the structure," equipment must be located in the same building as the housing unit you are enumerating. Such equipment may be located within the housing unit itself, or it may be in the hallway or in a room used by several units in the building. Sometimes it may even be necessary to go outdoors to reach that part of the structure in which the equipment is located. Equipment on an open porch is "outside the structure." Equipment on an enclosed porch, or enclosed by partitions on an otherwise open porch, or in the basement is "inside the structure."

217. Single-Unit and Multi-Unit Structures

A structure that contains only one housing unit is a "single-unit structure" (figs. 14A through 14E). A "multiunit structure" is a structure that contains two or more housing units (figs. 14F and 14G).

218. Determining Whether Equipment Is "For Exclusive Use"

Equipment is "For exclusive use," when it is used only by persons in one housing unit. If equipment is used by lodgers or other persons living in the housing unit, it is still "For Exclusive Use," provided that it is not also used by occupants of any other unit. When a structure consists of only one housing unit, all equipment located inside the structure is "For exclusive use."

219. Determining Whether Equipment Is "Shared"

Equipment is "Shared" if it is also used by occupants of housing units other than the one you are enumerating. Equipment is also "Shared" if it is intended for use by the occupants of a unit now vacant, as well as by the unit you are enumerating or vice versa. Shared equipment may be inside one of the units or may be centrally located where it can be reached by occupants of all units that share it.

220. Items H1 and H2. Sample Key and Address

Fill both these items by copying from the appropriate Listing Book entry. The instructions for them are printed on the top of the FOSDIC form and in the Listing Book.

221. Item H3. Type of Housing Unit

On the basis of observation indicate the appropriate category of the housing unit as follows:

a. House, apartment, flat—Mark this category for every housing unit you identify except trailers.

b. Trailer—Mark this category for each occupied house trailer whether mobile or on a permanent foundation. Vacant trailers and trailers used as extra sleeping rooms are not to be enumerated (see par. 13). Where one or more rooms have been added or built on to a trailer, it should be classified as a "house, apartment, or flat." But, if only a porch or open shed has been added or temporarily attached to a trailer, put it in the "Trailer" category.

Figure 14.—Number of units in structure.

222. Item H4. Access To Unit

Decide whether or not there is direct access or not on the basis of the definitions in paragraph 10.

a. Mark "direct from outside or common hall" in structures with only one housing unit. In regular apartment buildings, the access is usually direct from a common hall and this category should also be marked.

b. Mark "through another unit" for any unit whose occupants must pass through some part of another unit to reach their own quarters.

223. How To Obtain Reply

Item H4 can usually be marked on the basis of observation by noticing the way you come into the unit. When you do not enumerate in the unit, ask how occupants reach their quarters.

224. Item H5. Kitchen and Cooking Equipment

Kitchen and cooking equipment are defined in paragraphs 11 and 40. The term "For exclusive use" is explained in paragraph 218 and the term "Shared or none" is described in paragraph 219. Using these definitions, report this information in the following manner:

a. "For exclusive use"—Mark this circle when the kitchen or cooking equipment is used by the occupants of only one housing unit. You should also mark this circle when lodgers who do not have a separate housing unit use the landlord's cooking equipment.

b. "Shared or none"—Mark this circle when the kitchen or cooking equipment is used by the occupants of two or more housing units or when there is no kitchen or cooking equipment.

225. How To Obtain Information

If you do not see the kitchen or cooking equipment, question the person being interviewed.

a. In a one-unit structure, ask whether there is a kitchen and mark "For exclusive use" if the answer is "Yes"; "Shared or none" if the answer is "No."

b. In a multiunit structure, ask an additional question if the answer to the original question is "Yes" to determine whether the kitchen or cooking equipment is "For exclusive use" or "Shared."

226. Item H6. Condition of Unit

Item H6 calls for information about the quality of housing. It tells how many housing units are not providing adequate shelter and are, in their present condition, endangering the health, safety, or well-being of their occupants. We call such units dilapidated. For the units that are not dilapidated, we need to know how many are in good repair and, therefore, sound; and how many are in need of repair and, therefore, deteriorating (fig. 15).

Figure 15.--Sketch illustrating condition of housing.

(Reproduced from filmstrip on condition of a housing unit.)

227. Use of Observation

Judge the condition of housing units by your own observation. Do not ask the respondent about the condition of his unit. Judge each unit by its own structural characteristics and do not be influenced

by neighborhood, age of structure, or the race or color of the occupants. Look carefully at the house itself. Do not judge it by its surroundings, nor by its neat or drab appearance. Illustrations of condition are shown in figs. 16 to 37.

228. Defects Are Only Signs

The particular defects you are to look for were selected because they are signs of structural deficiencies which may themselves be hidden. For example, there may be rotted or termite-ridden joists or beams that only an engineering survey would find. Other defects such as damage to wiring from a leaky roof would be observed only by a more careful inspection than is possible during the census. Many defects can easily be seen, however, and these will help you decide whether a unit is dilapidated or not dilapidated; and if not dilapidated, whether it is sound or deteriorating.

229. Types of Defects

The types of defects you are to look for relate to weather tightness, extent of disrepair, hazards to physical safety of the occupants, and inadequate or makeshift construction. These defects are called (a) slight, (b) of an intermediate nature, or (c) critical, depending on their extent or degree as explained in the paragraphs that follow.

230. Slight Defects Defined

Slight defects are those flaws which are normally corrected during the course of regular maintenance. They do not affect the weather tightness of the housing unit nor do they endanger the safety or health of the occupants. Examples of these flaws include:

- Lack of paint.
- Slight damage to porch or steps.
- Slight wearing away of mortar between bricks or masonry.
- Small cracks in walls, plaster, or chimney.
- Cracked windows.
- Slight wear on floors, doorsills, doorframes, window sills, or window frames.
- Broken gutters or downspouts.

231. Intermediate Defects Defined

Defects classified as intermediate indicate the need of repair if the unit is to continue to provide safe and adequate shelter. They are more serious than those corrected by normal upkeep. Examples include:

- Holes, open cracks, rotted, loose, or missing materials in the foundation, walls, roof, floors, or ceilings, but not over a large area.
- Shaky or unsafe porch, steps, or railings.
- Several broken or missing window panes.
- Some rotted or loose window frames or sashes that are no longer rainproof or windproof.
- Broken or loose stair treads, or broken, loose, or missing risers, balusters, or railings of inside or outside stairs.
- Deep wear on doorsills, doorframes, outside or inside steps or floors.
- Missing bricks or cracks in chimney which are not serious enough to be a fire hazard.
- Makeshift chimney, such as stovepipe or other uninsulated pipes leading directly from the stove to the outside through a hole in the roof, wall, or window.

232. Critical Defects Defined

Critical defects indicate continued neglect or deep and serious damage to the structure. These defects can be corrected only by extensive repairs. In some instances they may be so serious that the structure should be torn down or rebuilt. Examples of critical defects you should look for are:

- Holes, open cracks, or rotted, loose, or missing material (clapboard siding, shingles, bricks, concrete, tile, plaster, or floorboards) over a large area of the foundation, outside walls, roof, chimney, or inside walls, floors, or ceilings.
- Substantial sagging of floors, walls, or roof.
- Extensive damage by storm, fire, or flood.

233. Sound House Defined

In most units that are sound, you will see no defects. However, if there are some slight defects, such as those listed in paragraph 230, you should still mark the housing unit as sound. If you see a large number of slight defects, however, be sure there are no more serious defects, such as an unsafe porch, which is included in the intermediate list and which would take the house out of the sound category (figs. 18 and 19).

234. Deteriorating House Defined

A deteriorating house needs more repair than would be provided in the course of regular maintenance, such as repainting, or nailing down a loose clapboard. A house is to be considered deteriorating when the flaws you see indicate a lack of proper upkeep. One defect serious enough to be listed as intermediate is enough to classify a house as deteriorating. Whenever repairs are needed for a house so that it will continue to provide adequate shelter or protection against the elements, report it as deteriorating (figs. 20 through 25).

235. Dilapidated House Defined

A dilapidated house must have one or more of the following types of defects:

- One or more critical defects (figs. 26 through 31).
- A combination of intermediate defects (figs. 32 and 33). No set number is required. It may be 2 or 3 or it may be 5 or 6, depending on whether these defects taken together indicate that the house no longer provides safe and adequate shelter.
- Inadequate original construction such that it does not provide adequate protection against the elements (figs. 34 and 35).

236. Inadequate Original Construction Defined

A unit is considered to be of inadequate original construction when it is made of makeshift materials or has been inadequately converted from a place not originally intended for living quarters. Examples of inadequate original construction are as follows:

- Shacks, huts, or tents.
- Structures with makeshift walls or roofs, or built of packing boxes, scrap lumber, or tin.
- Structures lacking foundations (walls rest directly on the ground).
- Structures with dirt floors.
- Inadequately converted cellars, sheds, barns, garages, or other places not originally intended for living quarters.

237. Procedure To Follow in Appraising Condition

Look at the outside of the structure as you approach each house or apartment building. If possible, as you go around the block look at the sides and back as well as the front of the structure. During the course of your interview, observe the interior, if you conduct the interview inside. In multiunit structures, always observe the condition of the halls and stairways. These are good indications of the condition of the whole structure. Report a unit as dilapidated if either the exterior or interior or both have sufficient defects to put in the dilapidated category. When you have decided that a house is not dilapidated, remember to look for defects which will tell you whether or not to classify it as sound or deteriorating.

238. Cautions for Appraising Condition of Units

Here are some guides to help you appraise the condition of housing units (figs. 36 and 37):

- Neighborhood—Evaluation of condition should be uniform, regardless of neighborhood or the race or color of the occupants. Follow the same standards whether the unit is in a good or in a poor neighborhood; whether it is in a white neighborhood or a nonwhite neighborhood; whether it is in the country or in the city. Your ED may consist of all sound housing, of all deteriorating housing, of all dilapidated housing, or of a mixture. Judge the condition of each unit on its own merits.

b. Lack of paint—Lack of paint alone does not justify classifying a unit as deteriorating or dilapidated. You should watch for the defects resulting from lack of paint, like rotting, rather than just lack of recent paint. On the other hand, new paint should not keep you from examining a unit for defects.

c. Attractiveness and cleanliness—Disregard the effect of attractiveness or dreariness in the house or its furnishings. Also disregard the level of cleanliness. An attractively decorated and spotlessly clean house can be dilapidated. A dreary or filthy house can be sound. Judge the structural condition of the unit, not the taste or housekeeping standards of its occupants.

d. Age of structure—The age of a structure alone does not necessarily determine its condition. Even brand new buildings of makeshift or inadequate original construction are dilapidated. Houses only 5 or 10 years old may have had exceptionally hard wear and inadequate maintenance and, therefore, may be deteriorating. Other houses built many years ago may still be sound. Old-fashioned facilities or design should not influence your judgment.

e. Brick and other masonry—Do not let the sturdiness of brick and other masonry walls keep you from looking at other parts of the structure.

f. Exterior covering—Simulated stone or imitation brick siding are sometimes used as wall covering on sound houses, but they often may conceal defects in deteriorating or dilapidated houses. When you see walls covered with artificial siding of any type, look for defects in other parts of the structure, particularly in the rear. Where such siding has not been carefully applied, or is coming loose, you can judge condition of the walls by the portion visible beneath the siding.

g. Multiunit structure—If there are defects in parts of the structure common to all units—that is, foundation, roof, walls, steps, public hallways, stairwells, vestibules, etc.—such defects are applicable to all units in the structure. If defects are not common to the entire structure, judge each unit separately.

h. Undergoing repairs—If a unit is undergoing repairs at the time of enumeration, report its condition as you think it will be when the repairs are completed.

i. Structural attachment—Consider attached portions, such as sheds, only if they are used as part of the living quarters. Ignore the condition of sheds, barns, or garages, not used for living purposes.

j. Extent or degree of defects—Remember that differences between the three classifications of conditions are largely a matter of degree or extent.

- (1) The defects in sound housing are those normally corrected by regular maintenance.
- (2) The defects in deteriorating housing are more serious but they do not extend over a large area.
- (3) The defects of dilapidated housing are either so critical or so widespread that the structure should be extensively repaired, rebuilt, or torn down.

239. Item H7. Occupancy

If the unit is occupied, i.e., one or more persons are listed in item P2, mark the first circle.

240. How To Report Vacant Units

Mark one of the three remaining circles for all vacant units—those for which item P2 is marked "VAC" or "VAC-URE" in accordance with the following:

a. Year-round—Although vacant at the time of enumeration, such a unit is usually occupied or intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis should be marked "Year-round." Units used only occasionally throughout the year are classified as "Year-round."

b. Migratory worker—Mark this category if the unit is intended for occupancy by migratory workers employed in farmwork during the crop season.

c. Seasonal—Mark this category if the unit is intended for occupancy during only a season of the year. Include units intended for recreational use, like beach cottages and hunting cabins. Where housing is offered to vacationers in the summer for summer sports and in the winter for winter sports, consider it as seasonal. Also include units held for herders, loggers, and cannery workers in this category.

253. Item H13. Vacancy Status

Mark item H13 for every vacant unit. This item should be marked if item P2 is marked "VAC" or "VAC-URE."

254. Categories Defined

a. For rent—Include units which are for rent and vacant units offered for rent or sale at the same time.

b. For sale only—Include units which are for sale only. A unit which is either "For sale or rent" is to be reported "For rent." The following additional instructions apply to multiunit structures only:

- (1) Individual units in a multiunit structure—In a cooperatively owned apartment building, most individual units are offered "For sale only." However, check to determine that a unit is not for rent.
- (2) Entire multiunit structures—When an entire multiunit structure is offered "For sale only," the individual units in it should be marked as follows:
 - (a) If the individual vacant unit in the structure is offered for rent, report it as "For rent."
 - (b) If the individual vacant unit is intended to be occupied by the new owner, report it as "For sale only."
 - (c) If the individual unit is vacant because it is being held for sale of the entire structure, report it as "Other vacant."

c. Rented or sold, not occupied—If any money rent has been paid or contracted for, but the renter has not yet moved in, or if the unit has recently been sold, but the new owner has not moved in, report it as "Rtd or sold, not occ."

d. For occasional use—If a unit is for weekend or other occasional use, mark "For occasional use."

e. Other vacant—If a unit does not fall into any of the above classifications, report it as "Other vacant." Some examples are:

- (1) Held for settlement of an estate.
- (2) Held for occupancy of a caretaker or janitor.
- (3) Held for sale of an entire multiunit structure (except as described in "For sale only" above).
- (4) Held for personal reasons of the owner or renter.
- (5) Temporarily occupied by persons all of whom have usual residence elsewhere (marked "VAC-URE" in item P2).

255. When To Determine Vacancy Status

Report the status of the vacant unit at the time of enumeration. Do not depend entirely on signs; ask a reliable respondent about the present status. For example, a "For sale" sign may be misleading; some houses for sale are also for rent, and a house with a "For sale" sign might already have been sold.

256. Item H14. Description of Property

This item appears on the PH-2 FOSDIC schedule only. It is to be filled only if the unit is "Owned or being bought" (first circle in item H12) or "Vacant—For sale only" (second circle in item H13). If neither classification applies, skip items H14 and H15.

Note: This information is also called for in item H39 on the back of the Household Questionnaire to be left in "A" units if you are using schedule PH-1.

257. Business Defined

In item H14 the term "business" means only a clearly recognizable commercial establishment, such as a restaurant, store, or filling station. If no commercial establishment exists on the property, it should be classified as having "No business."

258. Categories Defined

On the basis of observation mark the appropriate category as follows:

a. "1 unit: No business"—If the property includes only one housing unit and there is no indication that it also contains a business unit.

b. "1 unit: With business"—If there is only one housing unit on the property and, in addition, you observe a business unit which is part of the same property.

c. "2 + units"—If there are two or more housing units in the structure or if there is only one unit in the structure but other housing units on the property.

259. When To Ask Additional Questions

In order to be sure you enumerate all housing units, you will always have to find out whether there are other housing units in the building or elsewhere on the property. (See pars. 78 and 94.) Therefore, the only time you will need to ask additional questions to complete the "Description of property" item is when you are enumerating a property with one housing unit and observe an adjoining business structure which might be part of the same property. If in doubt, ask whether the business unit is part of the same property, and then mark "1 unit: With business" or "1 unit: No business," as appropriate.

266. Instructions for Housing Items To Be Completed at All Occupied "A" Units

Instructions in paragraph 151e for completing housing items on the Household Questionnaire (PH-7 or PH-8) outlined your duties at occupied "A" units. Among these duties you are to complete one or more housing items. Instructions for these items are given in paragraph 267.

267. Item H29. Number of Units in Structure

Obtain a count of all units, whether vacant or occupied, in the structure containing the sample unit or units.

a. For one-unit structures, mark whether the structure is detached or attached. (See definitions in par. 215 and fig. 14.)

b. For multiunit structures do not classify as attached or detached but enter the total number of units in the structure. This entry should be the same on the Household Questionnaire for each sample unit in the same structure.

268. Instructions for Housing Items To Be Completed At Occupied "A" Units in Structures Containing 5 or More Units

If there are 5 or more units in the structure, you should also complete the questionnaire items listed below. Although tenants in apartment houses will know what fuel they use for cooking (item H22, col. B), frequently they cannot answer questions about when the structure was built, or how it is heated. The best respondent for these questions usually is the resident owner, manager, agent or janitor.

a. Item H20. About when was this house originally built?

b. Item H21. How is your house or apartment heated?

c. Item H22. Questions on fuel used for heating house and water.

d. Item H39. Description of property—If you have completed a PH-1 schedule, you should also fill out item H39. The instructions for filling out this item appear in paragraph 256.

HOUSING UNITS ARE EITHER—
DILAPIDATED OR NOT DILAPIDATED

Figure 16.—
DILAPIDATED houses
no longer provide safe
and adequate shelter.

Figure 17.— Houses that are NOT DILAPIDATED are either—

(a) SOUND
and well maintained

or

(b) DETERIORATING
and in need of repair

SOUND houses may have—

Figure 18.—NO VISIBLE DEFECTS or—

Figure 19.—Only SLIGHT DEFECTS that are easily taken care of by regular upkeep—such as a loose bit of siding or a rusted gutter.

Houses are DETERIORATING if they have—

ONE OR MORE INTERMEDIATE DEFECTS

Figure 20.—A shaky and unsafe porch and steps.

Figure 21.—A small area of loose shingles.

Other INTERMEDIATE DEFECTS include—

Figure 22.—A loose window frame and loose bricks over a small area.

Figure 23.—Deep wear on floors and doorsills.

These DETERIORATING houses show INTERMEDIATE DEFECTS

Figure 24.—A shaky porch and a small area of missing material near the foundation.

Figure 25.—Lack of paint alone is only a slight defect, but continued neglect of painting may result in more serious defects—such as rotting window sills and deep wear on porch and steps. Also the chimney of this house is sagging.

Houses are DILAPIDATED if they have—

ONE OR MORE CRITICAL DEFECTS

Figure 26.—A bulging wall.

Figure 27.—A large area of missing plaster.

Other CRITICAL DEFECTS include—

Figure 28.—A deep hole in the foundation and missing siding.

Figure 29.—A large area of loose and rotted siding. Look carefully at other parts of the structure when you see artificial covering on outside walls.

These DILAPIDATED houses show CRITICAL DEFECTS—

Figure 30.—Noticeable sagging is a CRITICAL DEFECT.

Figure 31.—Extensive damage by fire or storm makes a house dilapidated.

Houses are DILAPIDATED if they have—

A COMBINATION OF INTERMEDIATE DEFECTS

so that they no longer provide adequate shelter

Figure 32.—These intermediate defects in chimney, flashing, and wall, when combined, are indications of other defects throughout the structure.

Figure 33.—Missing shingles, loose clapboards, porch damage, and a slight sag at the back of the house, call for extensive repairs. In combination, they are evidence of inadequate and unsafe housing.

Houses are DILAPIDATED if they are of—

INADEQUATE ORIGINAL CONSTRUCTION

Figure 34.—Makeshift material and makeshift chimney.

Figure 35.—Inadequate conversion of a shed not intended for living purposes.

CAUTIONS in appraising condition—

Figure 36.—Not all houses with artificial siding are dilapidated as in figure 29. Many have been restored and are sound. Judge each house on its own merits—not by the neighborhood or by the race or color of the occupants.

Figure 37.—Observe brick or other masonry structures carefully—both inside and out. These cracks and sagging window sills are critical defects because they are signs of structural damage you cannot see. They also indicate broken plaster and sagging floors inside. This is a dilapidated house.
